By  
Dr. Vikas Gupta  
CDLSIET Panniwala Mota

### ORTHOGRAPHIC PROJECTIONS:

IT IS A TECHNICAL DRAWING IN WHICH DIFFERENT VIEWS OF AN OBJECT ARE PROJECTED ON DIFFERENT REFERENCE PLANES OBSERVING PERPENDICULAR TO RESPECTIVE REFERENCE PLANE

Different Reference planes are  
**Horizontal Plane (HP),  
Vertical Frontal Plane (VP)  
Side Or Profile Plane (PP)**  
And

Different views are Front View (FV), Top View (TV) and Side View (SV)  
**FV is a view projected on VP,  
TV is a view projected on HP,  
SV is a view projected on PP**

**IMPORTANT TERMS OF ORTHOGRAPHIC PROJECTIONS:**  
1. Planes.  
2. Pattern of planes & Pattern of views  
3. Methods of drawing Orthographic Projections

### 1 PLANES

PRINCIPAL PLANES  
HP AND VP

AUXILIARY PLANES

Auxiliary Vertical Plane (A.V.P.)  
Auxiliary Inclined Plane (A.I.P.)  
Profile Plane (P.P.)

### 2 PATTERN OF PLANES & VIEWS (First Angle Method)

THIS IS A PICTORIAL SETUP OF ALL THREE PLANES. ARROW DIRECTION IS A NORMAL WAY OF OBSERVING THE OBJECT. BUT IN THIS DIRECTION ONLY A VIEW ON ONE PLANE CAN BE SEEN. THE OTHER PLANES AND VIEWS ON THOSE CAN NOT BE SEEN.

PROCEDURE TO SOLVE ABOVE PROBLEM:  
TO MAKE THOSE PLANES AVAILABLE FROM THE ARROW DIRECTION,  
I. HP IS ROTATED 90° DOWNWARD  
II. VP IS ROTATED 90° IN RIGHT SIDE HORIZONTAL  
III. PP IS 90° IN RIGHT SIDE HORIZONTAL.  
THIS WAY BOTH PLANES ARE BROUGHT IN THE SAME PLANE CONTAINING VP.

Click to view Animation

On clicking this button if a warning comes please click YES to continue, this program is safe for your pc.

HP IS ROTATED DOWNWARD 90° AND BROUGHT IN THE PLANE OF VP.  
VP IS ROTATED IN RIGHT SIDE 90° AND BROUGHT IN THE PLANE OF VP.  
PP IS ROTATED IN RIGHT SIDE 90° AND BROUGHT IN THE PLANE OF VP.

ACTUAL PATTERN OF PLANES & VIEWS OF ORTHOGRAPHIC PROJECTIONS DRAWN IN FIRST ANGLE METHOD ARE SHOWN BELOW.

### 3 Methods of Drawing Orthographic Projections

First Angle Projections Method  
Here views are drawn by placing object in 1<sup>st</sup> Quadrant (Fv above X-y, Tv below X-y)

Third Angle Projections Method  
Here views are drawn by placing object in 3<sup>rd</sup> Quadrant (Tv above X-y, Fv below X-y)

SYMBOLIC REPRESENTATION OF BOTH METHODS WITH AN OBJECT STANDING ON HP (GROUND) ON IT'S BASE.

NOTE:-  
HP term is used in 1<sup>st</sup> Angle method & For the same Ground term is used in 3<sup>rd</sup> Angle method of projections

### FIRST ANGLE PROJECTION

IN THIS METHOD, THE OBJECT IS ASSUMED TO BE SITUATED IN FIRST QUADRANT (MEANS ABOVE HP & IN FRONT OF VP). OBJECT IS IN BETWEEN OBSERVER & PLANE.

ACTUAL PATTERN OF PLANES & VIEWS OF PROJECTIONS

### THIRD ANGLE PROJECTION

IN THIS METHOD, THE OBJECT IS ASSUMED TO BE SITUATED IN THIRD QUADRANT (BELOW HP & BEHIND OF VP). PLANES BEING TRANSPARENT AND IN BETWEEN OBSERVER & OBJECT.

ACTUAL PATTERN OF PLANES & VIEWS OF THIRD ANGLE PROJECTIONS

### ORTHOGRAPHIC PROJECTIONS (MACHINE ELEMENTS)

OBJECT IS OBSERVED IN THREE DIRECTIONS. THE DIRECTIONS SHOULD BE NORMAL TO THE RESPECTIVE PLANES.  
AND NOW PROJECT THREE DIFFERENT VIEWS ON THOSE PLANES. THESE VIEWS ARE FRONT VIEW, TOP VIEW AND SIDE VIEW.

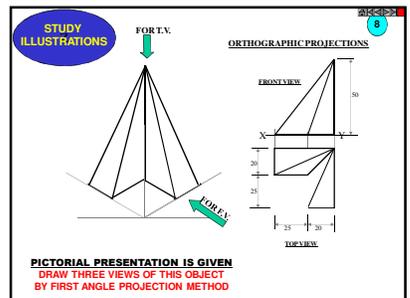

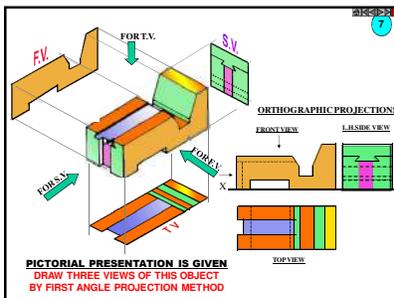

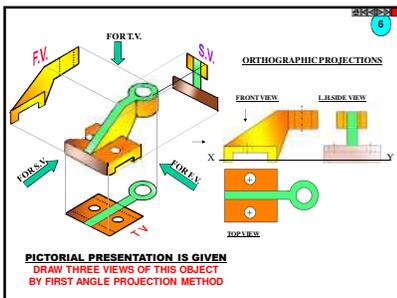

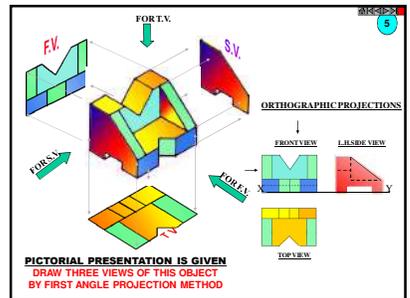

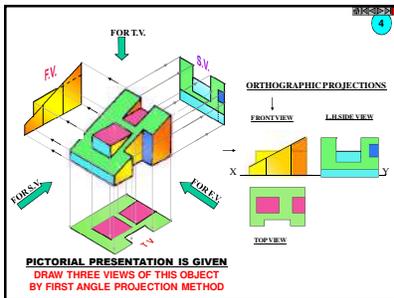

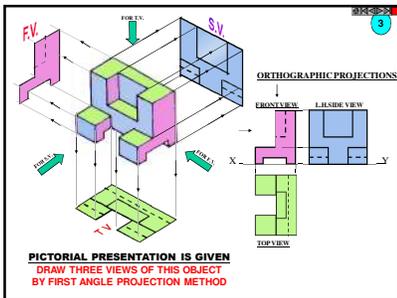

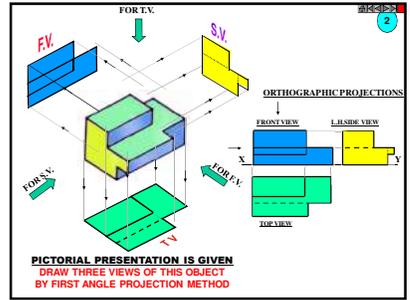

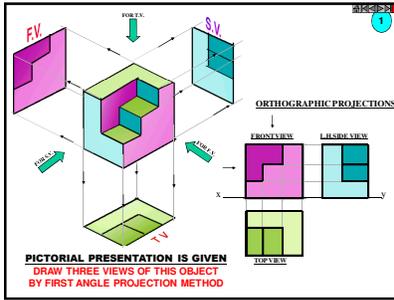

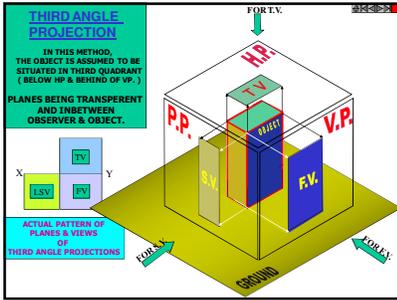

FRONT VIEW IS A VIEW PROJECTED ON VERTICAL PLANE (VP)  
TOP VIEW IS A VIEW PROJECTED ON HORIZONTAL PLANE (HP)  
SIDE VIEW IS A VIEW PROJECTED ON PROFILE PLANE (PP)

FIRST STUDY THE CONCEPT OF 1<sup>ST</sup> AND 3<sup>RD</sup> ANGLE PROJECTION METHODS  
AND THEN STUDY NEXT 26 ILLUSTRATED CASES CAREFULLY. TRY TO RECOGNIZE SURFACES PERPENDICULAR TO THE ARROW DIRECTIONS

### FIRST ANGLE PROJECTION

IN THIS METHOD, THE OBJECT IS ASSUMED TO BE SITUATED IN FIRST QUADRANT (MEANS ABOVE HP & IN FRONT OF VP). OBJECT IS IN BETWEEN OBSERVER & PLANE.

ACTUAL PATTERN OF PLANES & VIEWS OF PROJECTIONS

QUESTION 9

**ORTHOGRAHIC PROJECTIONS**

**PICTORIAL PRESENTATION IS GIVEN**  
DRAW THREE VIEWS OF THIS OBJECT BY FIRST ANGLE PROJECTION METHOD

QUESTION 10

**ORTHOGRAHIC PROJECTIONS**

**PICTORIAL PRESENTATION IS GIVEN**  
DRAW THREE VIEWS OF THIS OBJECT BY FIRST ANGLE PROJECTION METHOD

QUESTION 11

**ORTHOGRAHIC PROJECTIONS**

**PICTORIAL PRESENTATION IS GIVEN**  
DRAW THREE VIEWS OF THIS OBJECT BY FIRST ANGLE PROJECTION METHOD

QUESTION 12

**ORTHOGRAHIC PROJECTIONS**

**PICTORIAL PRESENTATION IS GIVEN**  
DRAW THREE VIEWS OF THIS OBJECT BY FIRST ANGLE PROJECTION METHOD

QUESTION 13

**STUDY ILLUSTRATIONS**

**ORTHOGRAHIC PROJECTIONS**

**PICTORIAL PRESENTATION IS GIVEN**  
DRAW FV AND TV OF THIS OBJECT BY FIRST ANGLE PROJECTION METHOD

QUESTION 14

**STUDY ILLUSTRATIONS**

**ORTHOGRAHIC PROJECTIONS**

**PICTORIAL PRESENTATION IS GIVEN**  
DRAW THREE VIEWS OF THIS OBJECT BY FIRST ANGLE PROJECTION METHOD

ALL VIEWS IDENTICAL

QUESTION 15

**ORTHOGRAPHIC PROJECTIONS**

**PICTORIAL PRESENTATION IS GIVEN**  
DRAW FV AND SV OF THIS OBJECT BY FIRST ANGLE PROJECTION METHOD

### ORTHOGRAPHIC PROJECTIONS OF POINTS, LINES, PLANES, AND SOLIDS.

**TO DRAW PROJECTIONS OF ANY OBJECT, ONE MUST HAVE FOLLOWING INFORMATION**

- A) OBJECT  
{ WITH IT'S DESCRIPTION, WELL DEFINED. }
- B) OBSERVER  
{ ALWAYS OBSERVING PERPENDICULAR TO RESP. REF. PLANE. }
- C) LOCATION OF OBJECT,  
{ MEANS IT'S POSITION WITH REFERENCE TO H.P. & V.P. }

TERMS 'ABOVE' & 'BELOW' WITH RESPECTIVE TO H.P. AND TERMS 'IN FRONT' & 'BEHIND' WITH RESPECTIVE TO V.P. FORM 4 QUADRANTS. OBJECTS CAN BE PLACED IN ANY ONE OF THESE 4 QUADRANTS.

IT IS INTERESTING TO LEARN THE EFFECT ON THE POSITIONS OF VIEWS ( F.V. , T.V. ) OF THE OBJECT WITH RESP. TO X-Y LINE, WHEN PLACED IN DIFFERENT QUADRANTS.

STUDY ILLUSTRATIONS GIVEN ON NEXT PAGES AND NOTE THE RESULTS TO MAKE IT EASY HERE A POINT  $\odot$  IS TAKEN AS AN OBJECT, BECAUSE IT'S ALL VIEWS ARE JUST POINTS.

### NOTATIONS

FOLLOWING NOTATIONS SHOULD BE FOLLOWED WHILE NAMING DIFFERENT VIEWS IN ORTHOGRAPHIC PROJECTIONS.

OBJECT	POINT A	LINE AB
IT'S TOP VIEW	a	a b
IT'S FRONT VIEW	a'	a' b'
IT'S SIDE VIEW	a''	a'' b''

SAME SYSTEM OF NOTATIONS SHOULD BE FOLLOWED INCREASE NUMBERS, LIKE 1, 2, 3 - ARE USED.

THIS QUADRANT PATTERN, IF OBSERVED ALONG X-Y LINE ( IN RED ARROW DIRECTION ) WILL EXACTLY APPEAR AS SHOWN ON RIGHT SIDE AND HENCE, IT IS FURTHER USED TO UNDERSTAND ILLUSTRATION PROPERLY.

POINT A IS PLACED IN DIFFERENT QUADRANTS AND IT'S F.V. & T.V. ARE DRAWN IN SAME PLANE FOR OBSERVER TO SEE CLEARLY. F.V. IS VISIBLE AS IT'S A VIEW ON VP. BUT AS T.V. IS A VIEW ON HP, IT IS ROTATED DOWNWARD 90° IN CLOCKWISE DIRECTION. THE PART IN FRONT OF XY LINE AND THE PART BEHIND VP COMES ABOVE.

Observe and note the process.

### PROJECTIONS OF A POINT IN FIRST QUADRANT

POINT A ABOVE HP & IN FRONT OF VP    POINT A ABOVE HP & IN VP    POINT A IN HP & IN FRONT OF VP

ORTHOGRAPHIC PRESENTATIONS OF ALL ABOVE CASES.

Fv above xy, Tv below xy.    Fv above xy, Tv on xy.    Fv on xy, Tv below xy.

### PROJECTIONS OF STRAIGHT LINES

INFORMATION REGARDING A LINE means IT'S LENGTH, POSITION OF IT'S ENDS WITH HP & VP. IT'S INCLINATIONS WITH HP & VP WILL BE GIVEN. AIM:- TO DRAW IT'S PROJECTIONS - MEANS FV & TV.

**SIMPLE CASES OF THE LINE**

1. A VERTICAL LINE (LINE PERPENDICULAR TO HP & // TO VP)
2. LINE PARALLEL TO BOTH HP & VP.
3. LINE INCLINED TO HP & PARALLEL TO VP.
4. LINE INCLINED TO VP & PARALLEL TO HP.
5. LINE INCLINED TO BOTH HP & VP.

STUDY ILLUSTRATIONS GIVEN ON NEXT PAGE SHOWING CLEARLY THE NATURE OF FV & TV OF LINES LISTED ABOVE AND NOTE RESULTS.

**Orthographic Pattern**

1. A Line perpendicular to Hp & // to Vp. Note: Fv is a vertical line showing True Length & Tv is a point.

2. A Line // to Hp & // to Vp. Note: Fv & Tv both are // to xy & both show T.L.

1. A Line inclined to Hp and parallel to Vp (Pictorial presentation). Note: Fv inclined to xy, Tv parallel to xy.

2. A Line inclined to Vp and parallel to Hp (Pictorial presentation). Note: Tv inclined to xy, Fv parallel to xy.

1. A Line inclined to both Hp and Vp (Pictorial presentation). Note: On removal of object i.e. Line AB, Fv as an image on Vp, Tv as an image on Hp.

Orthographic Projections: Fv is seen on Vp clearly, HP is rotated 90° downwards. Hence it comes below xy.

Note These Facts:- Both Fv & Tv are inclined to xy. (No view is parallel to xy). Both Fv & Tv are reduced lengths. (No view shows True Length).

**Orthographic Projections Means Fv & Tv of Line AB are shown below, with their respective inclinations  $\alpha$  &  $\beta$**

**Note the procedure:** When Fv & Tv known, How to find True Length. (Views are rotated to determine True Length & its inclinations with Hp & Vp).

**Note the procedure:** When True Length is known, How to locate Fv & Tv. (Component  $\alpha$  of TL is drawn which is further rotated to determine Fv).

**Note the procedure:** Here  $\alpha$  is component of TL w. gives length of Fv. Hence it is brought up to locus of a' and further rotated to get point a'. a' b' will be Fv. Similarly drawing component of other TL b', TV can be drawn.

The most important diagram showing graphical relations among all important parameters of this topic. Study and memorize it as a **GROUPY DIAGRAM** And use in solving various problems.

**Important parameters to be remembered with Notations used here onward**

- 1) True Length (TL) -  $a'b'$ ,  $a'b$
- 2) Angle of TL with Hp -  $\theta$
- 3) Angle of TL with Vp -  $\phi$
- 4) Angle of Fv with xy -  $\alpha$
- 5) Angle of Tv with xy -  $\beta$
- 6) LTV (length of FV) - Component ( $a-1$ )
- 7) LFV (length of TV) - Component ( $a-1$ )
- 8) Position of A: Distances of a & a' from xy
- 9) Position of B: Distances of b & b' from xy
- 10) Distance between End Projectors

**NOTE this**  
 $\theta$  &  $\alpha$  Construct with a'  
 $\theta$  &  $\beta$  Construct with a  
 a & b' on same locus

**Also Remember**  
 True Length is never rotated. It's horizontal component is drawn & it is further rotated to locate view.  
 Views are always rotated, made horizontal & then extended to locate TL, a', a, b, b'.

**GROUP (A)**

**GENERAL CASES OF THE LINE INCLINED TO BOTH HP & VP** (based on 30° parameters).

**PROBLEM 1)** Line AB is 75 mm long and it is 30° & 40° inclined to Hp & Vp respectively. End A is 12mm above Hp and 10 mm in front of Vp. Draw projections. Line is in 1<sup>st</sup> quadrant.

**SOLUTION STEPS:**

- 1) Draw xy line and one projector.
- 2) Locate a' 12mm above xy line & a 10mm below xy line.
- 3) Take 30° angle from a' & 40° from a and mark TL i.e. 75mm on both lines. Name those points b' and b, respectively.
- 4) Join both points with a' and a resp.
- 5) Draw horizontal lines (Locus) from both points.
- 6) Draw horizontal component of TL a b, from point b, and name it 1. (The length a-1 gives length of Fv as we have seen already)
- 7) Extend it up to locus of a' and rotating a' as center locate b' as shown. Join a' b' as Fv.
- 8) From b' drop a projector downward & get point b. Join a & b i.e. Tv.

**PROBLEM 2:** Line AB 75mm long makes 45° inclination with Vp while it's Fv makes 55°. End A is 10 mm above Hp and 15 mm in front of Vp. If line is in 1<sup>st</sup> quadrant draw its projections and find its inclination with Hp.

**SOLUTION STEPS:**

1. Draw xy line.
2. Draw one projector for a' & a
3. Locate a' 10mm above xy & a 15 mm below xy
4. Draw a line 45° inclined to xy from point a and cut TL 75 mm on it and name that point b.
5. Take 55° angle from a' for Fv above xy line.
6. Draw a vertical line from b, up to locus of a' and name it 1.
7. Continue it to locus of a' and rotate upward up to the line of Fv and name it b'. This a' b' line is Fv.
8. Drop a projector from b' on locus from point b and name intersecting point B.
9. Draw locus from b' and from a' with '1' distance cut point b'. Join a' b' as Fv and measure its angle  $\alpha$  at a'.
10. Join a b, as TL and measure its angle  $\beta$  at a. It will be true angle of line with Hp.

**PROBLEM 3:** Fv of line AB is 50° inclined to xy and measures 55 mm long while it's Tv is 60° inclined to xy line. If end A is 10 mm above Hp and 15 mm in front of Vp, draw its projections, End TL, inclinations of line with Hp & Vp.

**SOLUTION STEPS:**

1. Draw xy line and one projector.
2. Locate a' 10 mm above xy and a 15 mm below xy line.
3. Draw locus from these points.
4. Draw Fv 50° to xy from a' and mark b' Cutting 55mm on it.
5. Similarly draw Tv 60° to xy from a & drawing projector from b' Locate point b and join a b.
6. Then rotating view as shown, locate True Lengths ab, a' b', and their angles with Hp and Vp.

**PROBLEM 4 -** Line AB is 75 mm long. It's Fv and Tv measure 50 mm & 60 mm long respectively. End A is 10 mm above Hp and 15 mm in front of Vp. Draw projections of line AB if end B is in first quadrant. Find angle with Hp and Vp.

**SOLUTION STEPS:**

1. Draw xy line and one projector.
2. Locate a' 10 mm above xy and a 15 mm below xy line.
3. Draw locus from these points.
4. Cut 50mm distance on locus of a' & mark 1' on it as it is LTV.
5. Similarly cut 60mm on locus of a and mark point 1 as it is LFV.
6. From 1' draw a vertical line upward and from a' taking TL (75mm) in compass, mark b' point on it.
7. Draw locus from b'.
8. With same steps below get b point and draw also locus from b.
9. Now rotating one of the components i.e. a-1' locus b' and join a' with it to get Fv.
10. Locate tv similarly and measure Angles  $\theta$  &  $\phi$ .

**PROBLEM 5 -** TV of a 75 mm long Line CD, measures 50 mm. End C is in Hp and 50 mm in front of Vp. End D is 15 mm in front of Vp and it is above Hp. Draw projections of CD and find angles with Hp and Vp.

**SOLUTION STEPS:**

1. Draw xy line and one projector.
2. Locate c on xy and c' 50mm below xy line.
3. Draw locus from these points.
4. Draw locus of d' 15 mm below xy
5. Cut 50mm & 75 mm distance on locus of d from c and mark points d & d', as these are Tv and line CD lengths resp. & join both with c.
6. From d', draw a vertical line upward up to xy i.e. up to locus of c' and draw an arc as shown.
7. Then draw one projector from d to meet this arc at d' point & join c' d'.
8. Draw locus of d' and cut 75 mm on it from c as TL.
9. Measure Angles  $\theta$  &  $\phi$ .

**GROUP (B)**

**PROBLEMS INVOLVING TRACES OF THE LINE.**

**TRACES OF THE LINE:**

THESE ARE THE POINTS OF INTERSECTIONS OF A LINE (OR IT'S EXTENSION) WITH RESPECTIVE REFERENCE PLANES.

A LINE ITSELF OR IT'S EXTENSION, WHERE EVER TOUCHES H.P., THAT POINT IS CALLED TRACE OF THE LINE ON H.P. (IT IS CALLED H.T.)

A LINE ITSELF OR IT'S EXTENSION, WHERE EVER TOUCHES V.P., THAT POINT IS CALLED TRACE OF THE LINE ON V.P. (IT IS CALLED V.T.)

**V.T.:** It is a point on Vp. Hence it is called Fv of a point in Vp. Hence it's Tv comes on XY line. (Here onward named as 'V')

**H.T.:** It is a point on Hp. Hence it is called Tv of a point in Hp. Hence it's Fv comes on XY line. (Here onward named as 'H')

**STEPS TO LOCATE HT.** (WHEN PROJECTIONS ARE GIVEN)

1. Begin with FV. Extend FV up to XY line.
2. Name this point 'H'
3. Draw one projector from H'
4. Now extend Tv to meet this projector. This point is HT

**STEPS TO LOCATE VT.** (WHEN PROJECTIONS ARE GIVEN)

1. Begin with TV. Extend TV up to XY line.
2. Name this point 'V'
3. Draw one projector from V' (as it is a Tv of a point in Vp)
4. Now extend Fv to meet this projector. This point is VT

**Observe & note -**

1. Point V & V' always on one projector.
2. VT & V' always on xy line.
3. HT & H' always on one projector.
4. [V, V', V'] always co-linear.
5. [H, H', H] always co-linear.

These points are used to solve next three problems.

**PROBLEM 6** - Fv of line AB makes 45° angle with XY line and measures 60 mm. Line's TV makes 30° with XY line. End A is 15 mm above Hp and it's VT is 10 mm below Hp. Draw projections of line AB, determine inclinations with Hp & Vp and locate HT, VT.

**SOLUTION STEPS:-**  
 Draw xy line, one projector and locate  $a'$  15 mm above xy.  
 Take 45° angle from  $a'$  and marking 60 mm on it locate point  $b'$ .  
 Draw locus of  $V'$ , 10 mm below xy & extending FV to this locus locate  $VT$  as  $a''v''$  lie on one  $\alpha'$  line.  
 Draw projector from  $v''$ , locate  $v'$  on  $V'$ .  
 From  $v'$  take 30° angle downward as  $T_V$  and its inclination can begin with  $x$ .  
 Draw projector from  $b'$  and locate  $b''$  i.e.  $T_V$  point.  
 Now rotating views as usual TL, and its inclinations can be found.  
 Name extension of FV, touching xy as  $h'$  and below  $h'$  on extension of  $T_V$  locate HT.

**PROBLEM 7** - One end of line AB is 10mm above Hp and other end is 100 mm in-front of Vp. It's Fv is 45° inclined to xy while it's HT & VT are 45mm and 30 mm below xy respectively. Draw projections and find TL with its inclinations with Hp & Vp.

**SOLUTION STEPS:-**  
 Draw xy line, one projector and locate  $a'$  10 mm above xy.  
 Draw locus 100 mm below xy for points  $b'$  &  $b''$ .  
 Draw loc for VT and HT, 30 mm & 45 mm below xy respectively.  
 Take 45° angle from  $a'$  and extend that line backward to locate  $h'$  and VT. Locate  $v'$  on xy above VT.  
 Locate HT below  $h'$  as shown.  
 Then join  $v' - h'$  and extend to get top view end  $b''$ .  
 Draw projector upward and locate  $b'$ . Make  $a''$  &  $b''$  dark.  
 Now as usual rotating views find TL and its inclinations.

**PROBLEM 8** - Projector drawn from HT and VT of a line AB are 80 mm apart and those drawn from its ends are 50 mm apart. End A is 10 mm above Hp, VT is 35 mm below Hp while its HT is 45 mm in front of Vp. Draw projections, locate traces and find TL of line & inclinations with Hp and Vp.

**SOLUTION STEPS:-**  
 1. Draw xy line and two projectors, 40 mm apart and locate HT & VT, 35 mm below xy and 55 mm above xy respectively on those projectors.  
 2. Locate  $h'$  and  $v'$  on xy as usual.  
 3. Now just like previous two problems, Extending certain lines complete FV & TV And as usual find TL and its inclinations.

Instead of considering  $a$  &  $a'$  as projections of first point, if  $v$  &  $V'$  are considered as first point, then true inclinations of line with Hp & Vp i.e. angles  $\theta$  &  $\phi$  can be constructed with points VT & V respectively.

Then from point  $v$  & HT angles  $\beta$  &  $\alpha$  can be drawn.  
 From point  $V'$  &  $h'$  angles  $\alpha$  &  $\beta$  can be drawn.

**THIS CONCEPT IS USED TO SOLVE NEXT THREE PROBLEMS.**

**PROBLEM 9** - Line AB 100 mm long is 30° and 45° inclined to Hp & Vp respectively. End A is 10 mm above Hp and it's VT is 20 mm below Hp. Draw projections of the line and it's HT.

**SOLUTION STEPS:-**  
 Draw xy one projector and locate on it VT and V.  
 Draw locus of  $V'$  10 mm above xy.  
 Take 30° from VT and draw a line. Where it intersects with locus of  $V'$  name it  $a'$  as it is TL of that part.  
 From  $a'$  cut 100 mm (TL) on it and locate point  $b'$ .  
 Now from  $h'$  take 45° and draw a line downwards & Mark on it distance  $V'a'$  i.e. TL of extension & name it  $a''$ .  
 Extend this line by 100 mm and mark point  $b''$ .  
 Draw its component on locus of  $V'$ .  
 A further rotate to get other end of FV i.e.  $v'$ .  
 Join  $v'$  with VT and mark intersection point (with locus of  $v'$ ) and name it  $s'$ .  
 Now as usual locate points  $a$  and  $b$  and  $h'$  and HT.

**PROBLEM 10** - A line AB is 75 mm long. It's FV & TV make 45° and 60° inclinations with X-Y line resp. End A is 15 mm above Hp and VT is 20 mm below Vp. Line is in first quadrant. Draw projections, find inclinations with Hp & Vp. Also locate HT.

**SOLUTION STEPS:-**  
 Similar to the previous only change is instead of line's inclinations, views inclinations are given.  
 So first take those angles from VT & v. Properly construct FV & TV of extension, then determine it's TL ( $V'a'$ ) and on its extension mark TL of line and proceed and complete it.

**PROBLEM 11** - The projection drawn from VT & end A of line AB are 40mm apart. End A is 15mm above Hp and 25 mm in front of Vp. VT of line is 20 mm below Hp. If line is 75mm long, draw its projections, find inclinations with Hp & Vp.

Draw two projectors for VT & end A. Locate these points and then  
**YES!**  
**YOU CAN COMPLETE IT.**

**GROUP (C)**  
**CASES OF THE LINES IN A.V.P., A.I.P. & PROFILE PLANE.**

Line AB is in AIP as shown in above figure no.1.  
 It's FV (a'b') is shown projected on Vp (Looking in arrow direction). Here one can clearly see that the **Inclination of AIP with HP = Inclination of FV with XY line**.

Line AB is in AVP as shown in above figure no. 2.  
 It's TV (a''b'') is shown projected on Hp (Looking in arrow direction). Here one can clearly see that the **Inclination of AVP with VP = Inclination of TV with XY line**.

**LINE IN A PROFILE PLANE (MEANS IN A PLANE PERPENDICULAR TO BOTH HP & VP)**

For T.V.  
 For F.V.

**Orthographic Pattern of Line in Profile Plane**

**Results:**  
 1. TV & FV both are vertical, hence arrive on one single projector.  
 2. It's Side View shows True Length (TL).  
 3. Sum of its inclinations with HP & VP equals to 90° (i.e.  $\phi + \theta = 90^\circ$ ).  
 4. It's HT & VT arrive on same projector and can be easily located From Side View.

**OBSERVE CAREFULLY ABOVE GIVEN ILLUSTRATION AND 2<sup>ND</sup> SOLVED PROBLEM**

**PROBLEM 12** -> Line AB 80 mm long, makes 30° angle with Hp and lies in an Auxiliary Plane 45° inclined to Vp. End A is 15 mm above Hp and VT is 10 mm below Xy line. Draw projections, line angle with Vp and Hs.

Simply consider inclination of A/P as inclination of TV of our line, well then!  
You sure can complete it as previous problems!  
Go ahead!!!

**PROBLEM 13** -> A line AB, 75mm long, has one end A in Vp. Other end B is 15 mm above Hp and 50 mm in front of Vp. Draw the projections of the line when sum of its inclinations with HP & Vp is 90°, means it is lying in a profile plane. Find true angles with planes and its traces.

**SOLUTION STEPS:**  
After drawing xy line and one projector Locate top view of A i.e. point 'a' on xy as it is in Vp.  
Locate Fv of B i.e. b' 15 mm above xy as it is above Hp and Tv of B i.e. b, 50 mm below xy as it is 50 mm in front of Vp.  
Draw side view structure of Vp and Hp and locate S.V. of point B i.e. b".  
From this point cut 75 mm distance on Vp and Mark a' as A is in Vp. (This is also VT of line).  
From this point draw locus to left & get a".  
Extend SV up to Hp, it will be HT. As it is a TV Rotate it and bring it on projector of b.  
Now as discussed earlier SV gives TL of line and at the same time on extension up to Hp & Vp gives inclinations with those planes.

**APPLICATIONS OF PRINCIPLES OF PROJECTIONS OF LINES IN SOLVING CASES OF DIFFERENT PRACTICAL SITUATIONS.**

In these types of problems some situation in the field or some object will be described. It's relation with Ground (HP) and a Wall or some vertical object (VP) will be given. Indirectly information regarding Fv & Tv of some line or lines, inclined to both reference Planes will be given and you are supposed to draw its projections and further to determine its true Length and its inclinations with ground.

Here various problems along with actual pictures of those situations are given for you to understand those clearly. Now looking for views in given **ARROW** directions, YOU are supposed to draw projections & find answers, Of course you must visualize the situation properly.

CHECK YOUR ANSWERS WITH THE SOLUTIONS GIVEN IN THE END. **ALL THE BEST !!**

**PROBLEM 14**-> Two objects, a flower (A) and an orange (B) are within a rectangular compound wall, whose P & Q, are walls meeting at 90°. Flower A is 1M & 5.5 M from walls P & Q respectively. Orange B is 4M & 1.5M from walls P & Q respectively. Drawing projection, find distance between them if flower is 1.5 M and orange is 3.5 M above the ground. Consider suitable scale.

**PROBLEM 15** -> Two mangoes on a tree A & B are 1.5 m and 3.00 m above ground and those are 1.2 m & 1.5 m from a 0.3 m thick wall but on opposite sides of it. If the distance measured between them along the ground and parallel to wall is 2.6 m. Then find real distance between them by drawing their projections.

**PROBLEM 16** -> oa, ob, oc are three lines, 25mm, 45mm and 65mm long respectively. All equally inclined and the shortest is vertical. This fig. is TV of three rods OA, OB and OC whose ends A, B, & C are on ground and end O is 100mm above ground. Draw their projections and find length of each along with their angles with ground.

**PROBLEM 17**-> A pipe line from point A has a downward gradient 1:5 and it runs due East-South. Another Point B is 12 M from A and due East of A and in same level of A. Pipe line from B runs 20° Due East of South and meets pipe line from A at point C. Draw projections and find length of pipe line from B and its inclination with ground.

**PROBLEM 18**-> A person observes two objects, A & B, on the ground, from a tower, 15 M high. At the angles of depression 30° & 45°. Object A is in due North-West direction of observer and object B is due West direction. Draw projections of situation and find distance of objects from observer and from tower also.

**PROBLEM 19**-> Guy ropes of two poles fixed at 4.5m and 7.5 m above ground, are attached to a corner of a building 15 M high, make 30° and 45° inclinations with ground respectively. The poles are 10 M apart. Determine by drawing their projections, Length of each rope and distance of poles from building.

**PROBLEM 20-** A tank of 4 M height is to be strengthened by four stay rods from each corner by fixing their other ends to the flooring, at a point 1.2 M and 0.7 M from two adjacent walls respectively, as shown. Determine graphically length and angle of each rod with flooring.

**PROBLEM 21-** A horizontal wooden platform 2 M long and 1.5 M wide is supported by four chains from its corners and chains are attached to a hook 5 M above the center of the platform. Draw projectors of the objects and determine length of each chain along with its inclination with ground.

**PROBLEM 22.** A room is of size 6.5m L, 5m D, 3.5m high. An electric bulb hangs 1m below the center of ceiling. A switch is placed in one of the corners of the room, 1.5m above the flooring. Draw the projections and determine real distance between the bulb and switch.

**PROBLEM 23-** A PICTURE FRAME 2 M WIDE AND 1 M TALL IS RESTING ON HORIZONTAL WALL RAILING MAKES AN INCLINATION WITH WALL IT IS ATTACHED TO A HOOK IN THE WALL BY TWO STRINGS. THE HOOK IS 1.5 M ABOVE WALL RAILING. DETERMINE LENGTH OF EACH CHAIN AND TRUE ANGLE BETWEEN THEM

**PROBLEM NO.24**  
T.V. of a 75 mm long Line CD, measures 50 mm. End C is 15 mm below Hp and 50 mm in front of Vp. End D is 15 mm in front of Vp and it is above Hp. Draw projection of CD and find angles with Hp and Vp.

**SOME CASES OF THE LINE IN DIFFERENT QUADRANTS.**

**REMEMBER:**  
BELOW HP- Means- Fv below xy  
BEHIND V p- Means- Tv above xy.

**PROBLEM NO.25**  
End A of line AB is in Hp and 25 mm behind Vp. End B is Vp and 50mm above Hp. Distance between projectors is 70mm. Draw projections and find its inclinations with H, V.

**PROBLEM NO.26**  
End A of a line AB is 25mm below Hp and 35mm behind Vp. Line is 30° inclined to Hp. There is a point P on AB contained by both HP & VP. Draw projections, find inclination with Vp and traces.

**PROBLEM NO.27**  
End A of a line AB is 25mm above Hp and end B is 55mm behind Vp. The distance between end projectors is 75mm. If both its HT & VT coincide on xy in a point, 35mm from projector of A and within two projectors. Draw projections, find TL and angles HT, VT.

**PROJECTIONS OF PLANES**

**In this topic various plane figures are the objects.**

**What is usually asked in the problem?**

To draw their projections means F.V. T.V. & S.V.

**What will be given in the problem?**

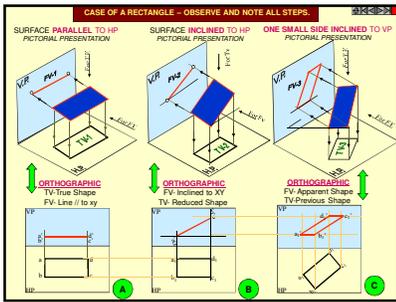

1. Description of the plane figure.
2. Its position with HP and VP.

**In which manner it's position with HP & VP will be described?**

1. Inclination of its SURFACE with one of the reference planes will be given.
2. Inclination of one of its EDGES with other reference plane will be given (Hence this will be a case of an object inclined to both reference Planes.)

**What you must remember**

Surface & Edge inclination given the most cases.

**PROCEDURE OF SOLVING THE PROBLEM.**  
IN THREE STEPS EACH PROBLEM CAN BE SOLVED! (As Shown in Previous Illustration)

**STEP 1.** Assume suitable conditions & draw Fv & Tv of initial position.  
**STEP 2.** Now consider surface inclination & draw 2<sup>nd</sup> Fv & Tv.  
**STEP 3.** After this, consider side edge inclination and draw 3<sup>rd</sup> (final) Fv & Tv.

**ASSUMPTIONS FOR INITIAL POSITION:**  
(Initial Position means assuming surface // to HP or VP)  
1. If in problem surface is inclined to HP – assume it // HP  
Or If surface is inclined to VP – assume it // to VP  
2. Now if surface is assumed // to HP- It's TV will show True Shape.  
And If surface is assumed // to VP – It's FV will show True Shape.  
3. Hence begin with drawing TV or FV as True Shape.  
4. While drawing this True Shape – keep one side edge ( which is making inclination) perpendicular to xy line ( similar to pair no. 1 on previous page illustration ).

Now Complete STEP 3, By making side edge inclined to the resp plane & project it's other view (Ref. 3<sup>rd</sup> pair on previous page illustration)

Now Complete STEP 3, By making side inclined to the resp plane & project it's other view. (Ref. 3<sup>rd</sup> pair on previous page illustration)

**APPLY SAME STEPS TO SOLVE NEXT ELEVEN PROBLEMS**

**Problem 1:**  
Rectangle 30mm and 50mm sides is resting on HP on one small side which is 30° inclined to VP, while the surface of the plane makes 45° inclination with HP. Draw it's projections.

Read problem and answer following questions  
1. Surface inclined to which plane? ——— HP  
2. Assumption for initial position? ——— // to HP  
3. So which view will show True shape? ——— TV  
4. Which side will be vertical? ——— One small side.  
Hence begin with TV, draw rectangle below X-Y drawing one small side vertical.

Surface // to Hp  
Surface inclined to Hp

**Problem 2:**  
A 30° - 60° set square of longest side 100 mm long, is in VP and 30° inclined to HP while its surface is 45° inclined to VP. Draw it's projections

Read problem and answer following questions  
1. Surface inclined to which plane? ——— VP  
2. Assumption for initial position? ——— // to VP  
3. So which view will show True shape? ——— FV  
4. Which side will be vertical? ——— longest side.

(Surface & Side inclinations directly given)  
Hence begin with FV, draw triangle above X-Y keeping longest side vertical.

side inclined to Hp  
Surface // to Vp Surface inclined to Vp

**Problem 3:**  
A 30° - 60° set square of longest side 100 mm long is in VP and it's surface 45° inclined to VP. One end of longest side is 10 mm and other end is 30 mm above HP. Draw it's projections

Read problem and answer following questions  
1. Surface inclined to which plane? ——— Vp  
2. Assumption for initial position? ——— // to VP  
3. So which view will show True shape? ——— FV  
4. Which side will be vertical? ——— longest side.

(Surface inclination directly given. Side inclination indirectly given)  
Hence begin with FV, draw triangle above X-Y keeping longest side vertical.

First TWO steps are similar to previous problem. Note the manner in which side inclination is given. End A: 30 mm above Hp & End B: is 10 mm above Hp. So redraw 2<sup>nd</sup> Fv as final Fv placing these ends as said.

**Problem 4:**  
A regular pentagon of 30 mm sides is resting on HP on one of it's sides with it's surface 45° inclined to HP. Draw it's projections when the side in HP makes 30° angle with VP

Read problem and answer following questions  
1. Surface inclined to which plane? ——— HP  
2. Assumption for initial position? ——— // to HP  
3. So which view will show True shape? ——— TV  
4. Which side will be vertical? ——— any side.  
Hence begin with TV draw pentagon below X-Y line, taking one side vertical.

**SURFACE AND SIDE INCLINATIONS ARE DIRECTLY GIVEN.**

**Problem 5:**  
A regular pentagon of 30 mm sides is resting on HP on one of it's sides while it's opposite vertex (corner) is 30 mm above HP. Draw projections when side in HP is 30° inclined to VP.

Read problem and answer following questions  
1. Surface inclined to which plane? ——— HP  
2. Assumption for initial position? ——— // to HP  
3. So which view will show True shape? ——— TV  
4. Which side will be vertical? ——— any side.  
Hence begin with TV draw pentagon below X-Y line, taking one side vertical.

**SURFACE INCLINATION INDIRECTLY GIVEN. SIDE INCLINATION DIRECTLY GIVEN.**

ONLY CHANGE is the manner in which surface inclination is described: One side on Hp & it's opposite corner 30 mm above Hp. Hence redraw 1<sup>st</sup> Fv as a 2<sup>nd</sup> Fv making above arrangement. Keep ab' on xy & d' 30 mm above xy.

**Problem 6:**  
A rhombus of diagonals 40 mm and 70 mm long respectively has one end of it's longer diagonal in HP while the diagonal is 35° inclined to HP. If the top view of the same diagonal makes 40° inclination with VP, draw it's projections.

Read problem and answer following questions  
1. Surface inclined to which plane? ——— HP  
2. Assumption for initial position? ——— // to HP  
3. So which view will show True shape? ——— TV  
4. Which diagonal horizontal? ——— Longer  
Hence begin with TV draw rhombus below X-Y line, taking longer diagonal // to X-Y

The difference in these two problems is in step 3 only in problem no. 6 inclination of Tv of that diagonal is given. It could be drawn directly as shown in 3<sup>rd</sup> step. While in no. 7 angle of diagonal itself (i.e. it's TL) is given. Hence here angle of TL is taken locus of c1 is drawn and then LTV (i.e. a1c1) is marked and final TV was completed. Study illustration carefully.

**Problem 7:**  
A rhombus of diagonals 40 mm and 70 mm long respectively having one end of it's longer diagonal in HP while that diagonal is 35° inclined to HP and makes 40° inclination with VP. Draw it's projections.

Note the difference in construction of 3<sup>rd</sup> step in both solutions.

**Problem 8:**  
A circle of 50 mm diameter is resting on HP on end A of it's diameter AC which is 30° inclined to Hp while it's Tv is 45° inclined to Vp. Draw it's projections.

Read problem and answer following questions  
1. Surface inclined to which plane? ——— HP  
2. Assumption for initial position? ——— // to HP  
3. So which view will show True shape? ——— TV  
4. Which diameter horizontal? ——— AC  
Hence begin with TV draw rhombus below X-Y line, taking longer diagonal // to X-Y

The difference in these two problems is in step 3 only in problem no. 8 inclination of Tv of that diagonal is given. It could be drawn directly as shown in 3<sup>rd</sup> step. While in no. 9 angle of AC itself (i.e. it's TL) is given. Hence here angle of TL is taken locus of c1 is drawn and then LTV (i.e. a1c1) is marked and final TV was completed. Study illustration carefully.

**Problem 9:**  
A circle of 50 mm diameter is resting on Hp on end A of it's diameter AC which is 30° inclined to Hp while it makes 45° inclined to Vp. Draw it's projections.

Note the difference in construction of 3<sup>rd</sup> step in both solutions.

**Problem 10:** End A of diameter AB of a circle is in HP and end B is in VP. Diameter AB, 50 mm long is  $30^\circ$  &  $40^\circ$  inclined to VP & VP respectively. Draw projections of circle.

Read problem and answer following questions:  
 1. Surface inclined to which plane? ..... **HP**  
 2. Assumption for initial position? ..... **// to HP**  
 3. So which view will show True shape? ..... **TV**  
 4. Which diameter horizontal? ..... **AB**  
**Hence begin with TV draw CIRCLE below X-Y line, taking DIA. AB // to X-Y**

The procedure is similar to previous problem of circle - i.e. by the 1<sup>st</sup> view circle is drawn in TV.  
 Line HP contains True Length (inclination of the HP is decided) assuming that the remaining parts - the true DIM of FV's projections with HP & VP is given. Means Line AB lies in a Profile Plane.  
 Hence its both FV & FV must arrive on one single projection.  
**So do the construction accordingly AND note the case carefully.**

**IMPORTANT POINTS**  
 1. In this case the plane of the figure always remains perpendicular to HP.  
 2. It may remain parallel or inclined to VP.  
 3. Hence FV in this case will be always a LINE view.  
 4. Assuming surface // to VP, draw true shape is suspended position as FV. (Here keep line joining point of contact & centroid of fig. vertical)  
 5. Always begin with FV as a True Shape but in a suspended position. AS shown in 1<sup>st</sup> FV.

**SOLVE SEPARATELY ON DRAWING SHEET GIVING NAMES TO VARIOUS POINTS AS USUAL AS THE CASE IS IMPORTANT**

**Problem 11:** A hexagonal lamina has one side in HP and its opposite parallel side is 25 mm above Hp and to VP. Draw it's projections. Take side of hexagon 30 mm long.

Read problem and answer following questions:  
 1. Surface inclined to which plane? ..... **HP**  
 2. Assumption for initial position? ..... **// to HP**  
 3. So which view will show True shape? ..... **TV**  
 4. Which diameter horizontal? ..... **AC**  
**Hence begin with TV draw rhombus below X-Y line, taking longer diagonal // to X-Y**

**ONLY CHANGE** is the manner in which surface inclination is described:  
 One side on B & FV opposite side 25 mm above Hp  
 Hence rotate 1<sup>st</sup> FV as a 2<sup>nd</sup> FV making above arrangement. Keep a'b' on xy & c' 25 mm above xy.

**As 3<sup>rd</sup> step** redraw 2<sup>nd</sup> FV keeping side DE on xy line. Because it is in VP as said in problem.

**FREELY SUSPENDED CASES.**

**Problem 12:** An isosceles triangle of 40 mm long base side, 60 mm long altitude is freely suspended from one corner of Base side it's plane is  $45^\circ$  inclined to VP. Draw it's projections.

**IMPORTANT POINTS**  
 1. In this case the plane of the figure always remains perpendicular to HP.  
 2. It may remain parallel or inclined to VP.  
 3. Hence FV in this case will be always a LINE view.  
 4. Assuming surface // to VP, draw true shape is suspended position as FV. (Here keep line joining point of contact & centroid of fig. vertical)  
 5. Always begin with FV as a True Shape but in a suspended position. AS shown in 1<sup>st</sup> FV.

**First draw a given triangle with given dimensions. Locate it's centroid position and join it with point of suspension.**

**Similarly solve next problem of Semi-circle**

**Problem 13:** A semicircle of 100 mm diameter is suspended from a point on its straight edge 20 mm from the midpoint of that edge so that the surface makes an angle of  $45^\circ$  with VP. Draw its projections.

**IMPORTANT POINTS**  
 1. In this case the plane of the figure always remains perpendicular to HP.  
 2. It may remain parallel or inclined to VP.  
 3. Hence FV in this case will be always a LINE view.  
 4. Assuming surface // to VP, draw true shape is suspended position as FV. (Here keep line joining point of contact & centroid of fig. vertical)  
 5. Always begin with FV as a True Shape but in a suspended position. AS shown in 1<sup>st</sup> FV.

**First draw a given semicircle with given diameter. Locate it's centroid position and join it with point of suspension.**

**To determine true shape of plane figure when it's projections are given BY USING AUXILIARY PLANE METHOD**

**WHAT WILL BE THE PROBLEM?**  
 Description of final FV & TV will be given. You are supposed to determine true shape of that plane figure.

**Follow the below given steps:**  
 1. Draw the given FV & TV as per the given information in problem.  
 2. Then among all lines of FV & TV select a line showing True Length (TL). (It's other view must be // to xy)  
 3. Draw x,y, perpendicular to this line showing TL.  
 4. Project view on x,y, (it must be a line view)  
 5. Draw x'y' // to this line view & project new view on it.  
**It will be the required answer i.e. True Shape.**

**This helps you understand:**  
 If you carefully study and observe the solution of all previous problems you will find:  
**IF ONE VIEW IS A LINE VIEW & THAT TOO PARALLEL TO XY LINE, THEN AND THEN IT'S OTHER VIEW WILL SHOW TRUE SHAPE.**

**NOW FINAL VIEWS ARE ALWAYS SOME SHAPE, NOT LINE VIEWS: SO APPLYING ABOVE METHOD: WE FIRST CONVERT ONE VIEW IN INCLINED LINE VIEW. (By using x1y1 auxiliary) THEN BY MAKING IT // TO X2Y2 WE GET TRUE SHAPE.**

**Study Next Four Cases**

**Problem 14:** TV is a triangle abc. Ab is 50 mm long, angle cab is  $30^\circ$  and angle cba is  $60^\circ$ . a'b' is a FV at 25 mm, b' is 40 mm and c' is 10 mm above Hp respectively. Draw projections of that figure and find it's true shape.

**As per the procedure:**  
 1. First draw FV & Tv as per the data.  
 2. In Tv line ab is // to xy hence it's other view a'b' is TL. So draw x,y, perpendicular to it.  
 3. Project view on x,y.  
 a) First draw projectors from a'b' & c' on x,y.  
 b) from xy take distances of a'b' & c' (TV) mark on these projectors from x,y. Name points a1b1 & c1.  
 c) This line view is an Aux. TV. Draw x2y2 // to this line view and project Aux. FV on it. for that from x,y, take distances of b' & c' and mark from x2y2 on new projectors.  
 4. Name points a', b', & c', and join them. This will be the required true shape.

**ALWAYS FOR NEW FV TAKE DISTANCES OF PREVIOUS FV AND FOR NEW TV, DISTANCES OF PREVIOUS TV. REMEMBER!!**

**Problem 15:** FV & TV of a triangular plate are shown. Determine it's true shape.

**USE SAME PROCEDURE STEPS OF PREVIOUS PROBLEM BUT THERE IS ONE DIFFICULTY**  
 NO LINE IS // TO XY IN ANY VIEW MEANS NO TL IS AVAILABLE.  
 IN SUCH CASES DRAW ONE LINE // TO XY IN ANY VIEW & IT'S OTHER VIEW CAN BE CONSIDERED AS TL FOR THE PURPOSE.  
 HERE a'1 line in FV is drawn // to xy. HENCE it's Tv becomes TL.  
 THEN FOLLOW SAME STEPS AND DETERMINE TRUE SHAPE. (STUDY THE ILLUSTRATION)

**ALWAYS FOR NEW FV TAKE DISTANCES OF PREVIOUS FV AND FOR NEW TV, DISTANCES OF PREVIOUS TV. REMEMBER!!**

**PROBLEM 16:** FV & Tv both are circles of 50 mm diameter. Determine true shape of an elliptical plate.

**ADOPT SAME PROCEDURE**  
 a'b' is considered as line // to xy. Then a'c' becomes TL for the purpose. Using steps properly true shape can be easily determined.

**Study the illustration.**

**ALWAYS FOR NEW FV TAKE DISTANCES OF PREVIOUS FV AND FOR NEW TV, DISTANCES OF PREVIOUS TV. REMEMBER!!**

**Problem 17:** Draw a regular pentagon of 50 mm side with one side  $30^\circ$  inclined to xy. The figure is TV of some plane, whose FV is a line  $45^\circ$  inclined to xy. Determine it's true shape.

**IN THIS CASE ALSO TRUE LENGTH IS NOT AVAILABLE IN ANY VIEW.**  
 BUT ACTUALLY WE DONOT REQUIRE TL TO FIND IT'S TRUE SHAPE. AS ONE VIEW (FV) IS ALREADY A LINE VIEW, SO JUST BY DRAWING X1Y1 // TO THIS VIEW WE CAN PROJECT VIEW ON IT AND GET TRUE SHAPE. STUDY THE ILLUSTRATION.

**ALWAYS FOR NEW FV TAKE DISTANCES OF PREVIOUS FV AND FOR NEW TV, DISTANCES OF PREVIOUS TV. REMEMBER!!**
