

# Chapter 1

## Data Communications and NM Overview

# Outline

- Analogy of telephone network
- Data and telecommunication network
- Distributed computing environment
- Internet
- Protocols and standards
- IT management
- Network and system management
- Current status and future of network management

---

## Notes

# Telephone Network

- Characteristics:
  - Reliable - does what is expected of it
  - Dependable - always there when you need it (remember 911?)
  - Good quality (connection) - hearing each other well
- Reasons:
  - Good planning, design, and implementation
  - Good operation and management of network

---

## Notes

# Telephone Network Model

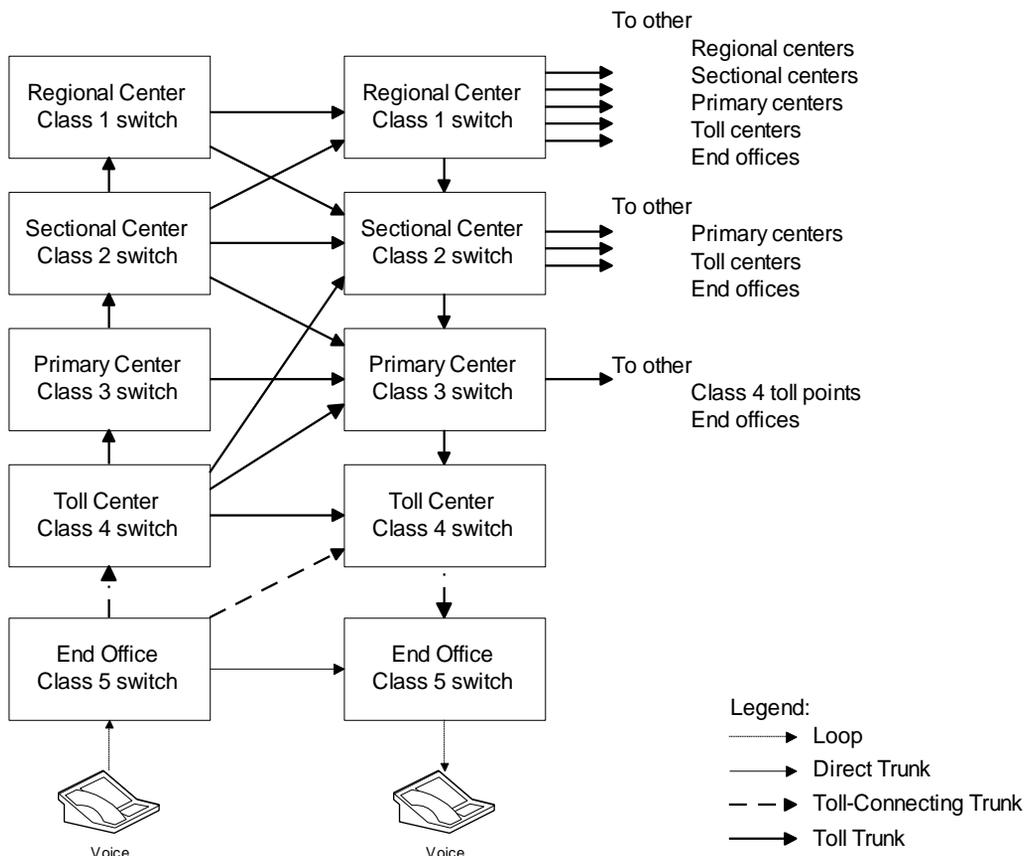

Figure 1.1 Telephone Network Model

## Notes

- Notice the hierarchy of switches
- Primary and secondary routes programmed
- Automatic routing
- Where is the most likely failure?
- Use of Operations Systems to ensure QoS

# Operations Systems / NOC

- Monitor telephone network parameters
  - S/N ratio, transmission loss, call blockage, etc.
- Real-time management of network
- Trunk (logical entity between switches) maintenance system measures loss and S/N. Trunks not meeting QoS are removed before customer notices poor quality
- Traffic measurement systems measure call blockage. Additional switch planned to keep the call blockage below acceptable level
- Operations systems are distributed at central offices
- Network management done centrally from Network Operations Center (NOC)

---

## Notes

# Data and Telecommunication Network

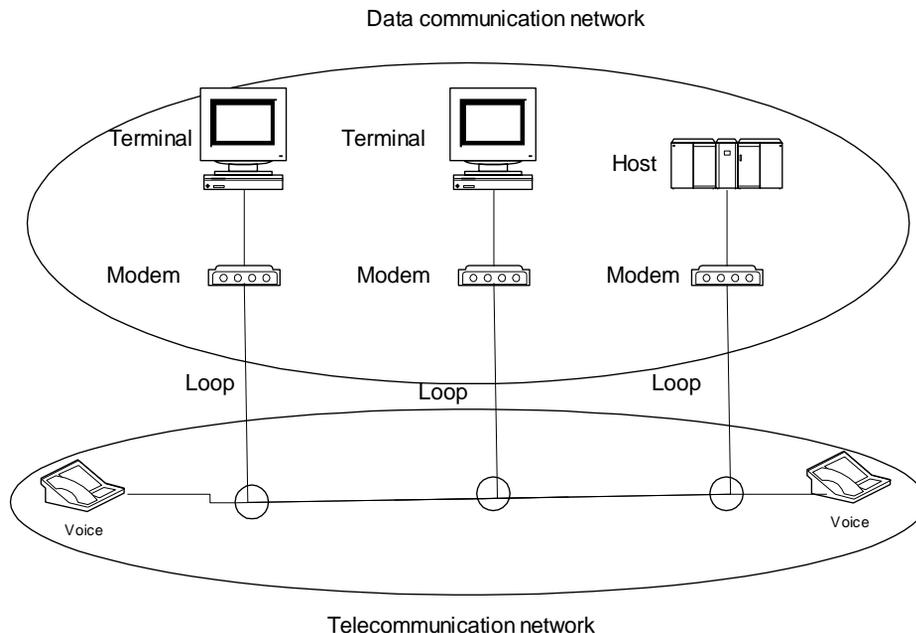

Figure 1.3 Data and Telecommunication Networks

## Notes

- Computer data is carried over long distance by telephone (telecommunication network)
- Output of telephone is analog and output of computers is digital
- Modem is used to “modulate” and “demodulate” computer data to analog format and back
- Clear distinction between the two networks is getting fuzzier with modern multimedia networks

# IBM SNA Architecture

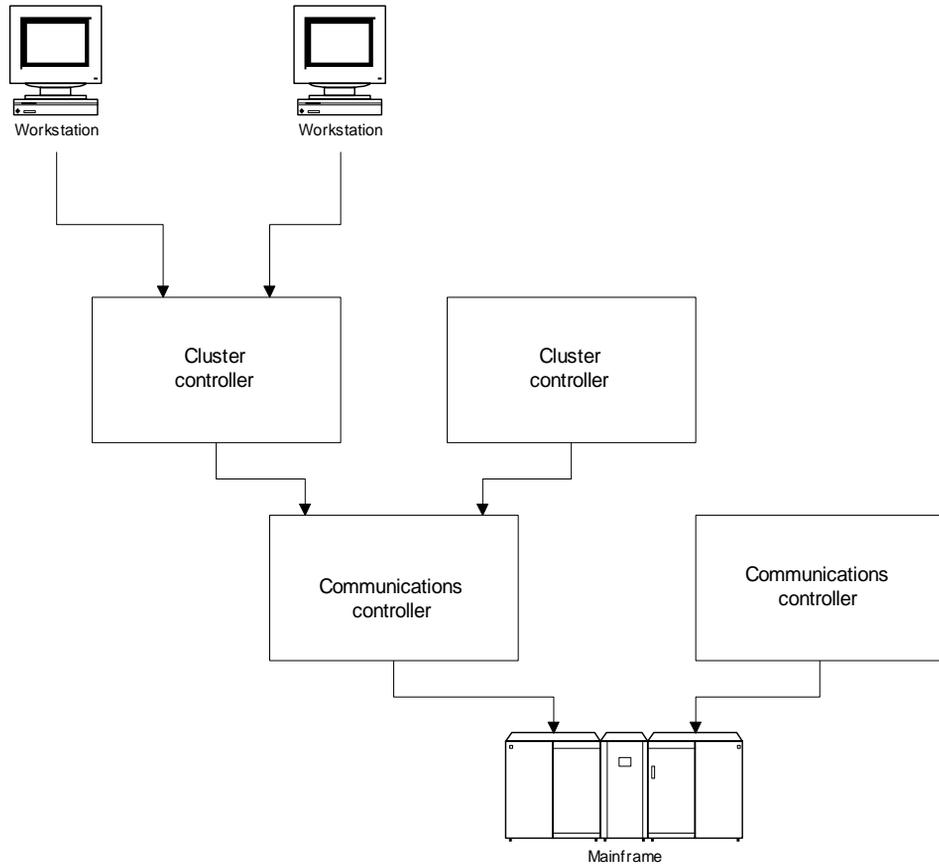

Figure 1.5 IBM Systems Network Architecture Model

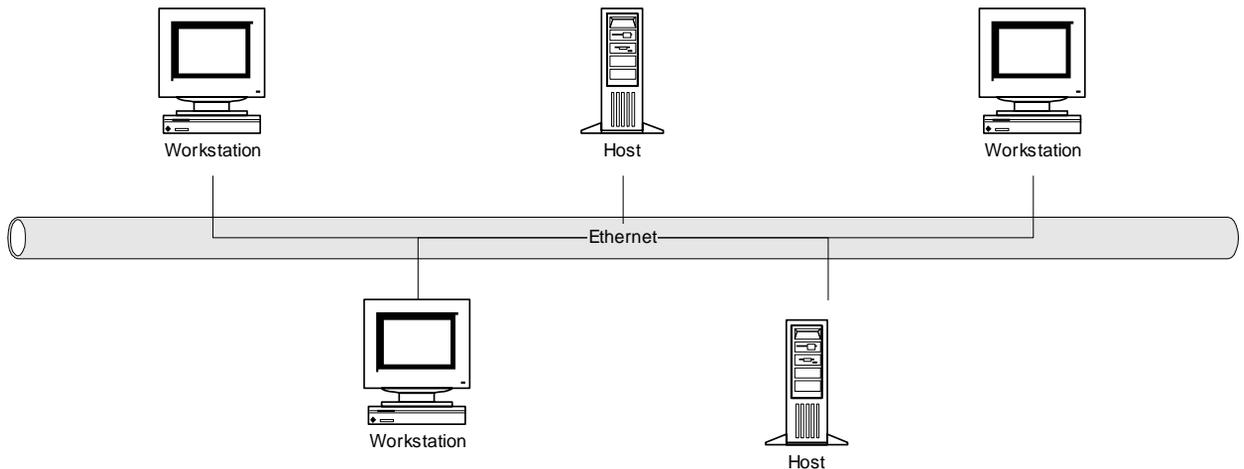

## Notes

- IBM System Network Architecture (SNA) is a major step in network architecture
- SNA is based on multitude of (dumb) terminals accessing a mainframe host at a remote location

---

# DCE with LAN

DCE.. Distributed Computing Environment

**(a) Hosts and Workstations on Local LAN**

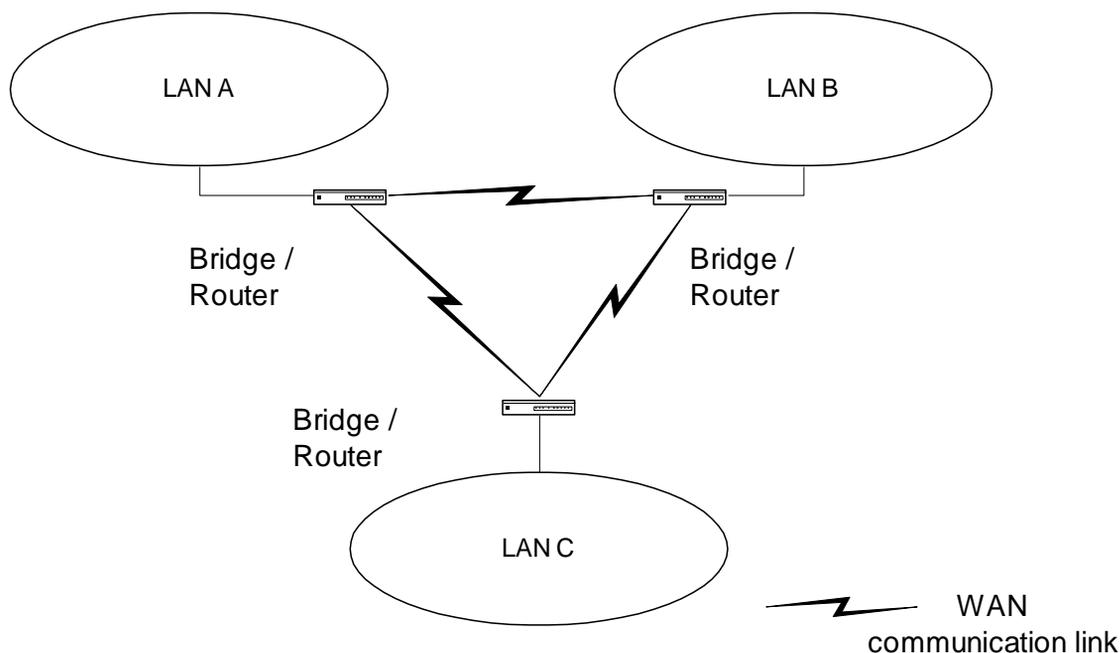

---

## Notes

- Driving technologies for DCE:
  - Desktop processor
  - LAN
  - LAN - WAN network

---

# LAN-WAN Network

---

## Notes

- Major impacts of DCE:
  - No more monopolistic service provider
  - No centralized IT controller
  - Hosts doing specialized function
  - Client/Server architecture formed the core of DCE network

---

# Client/Server Model

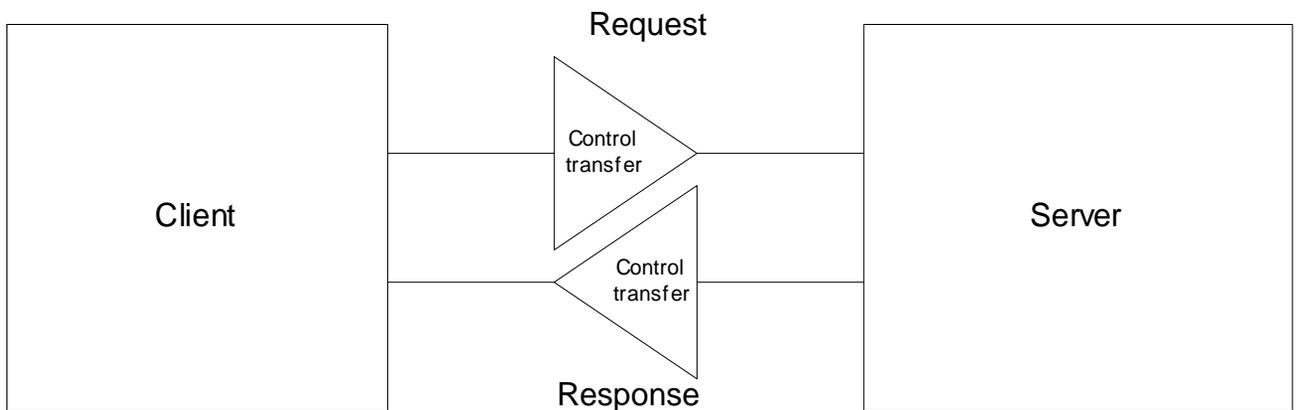

Figure 1.7 Simple Client-Server Model

---

## Notes

- Post office analogy; clerk the server, and the customer the client
- Client always initiates requests
- Server always responds
- Notice that control is handed over to the receiving entity.

# Client/Server Examples

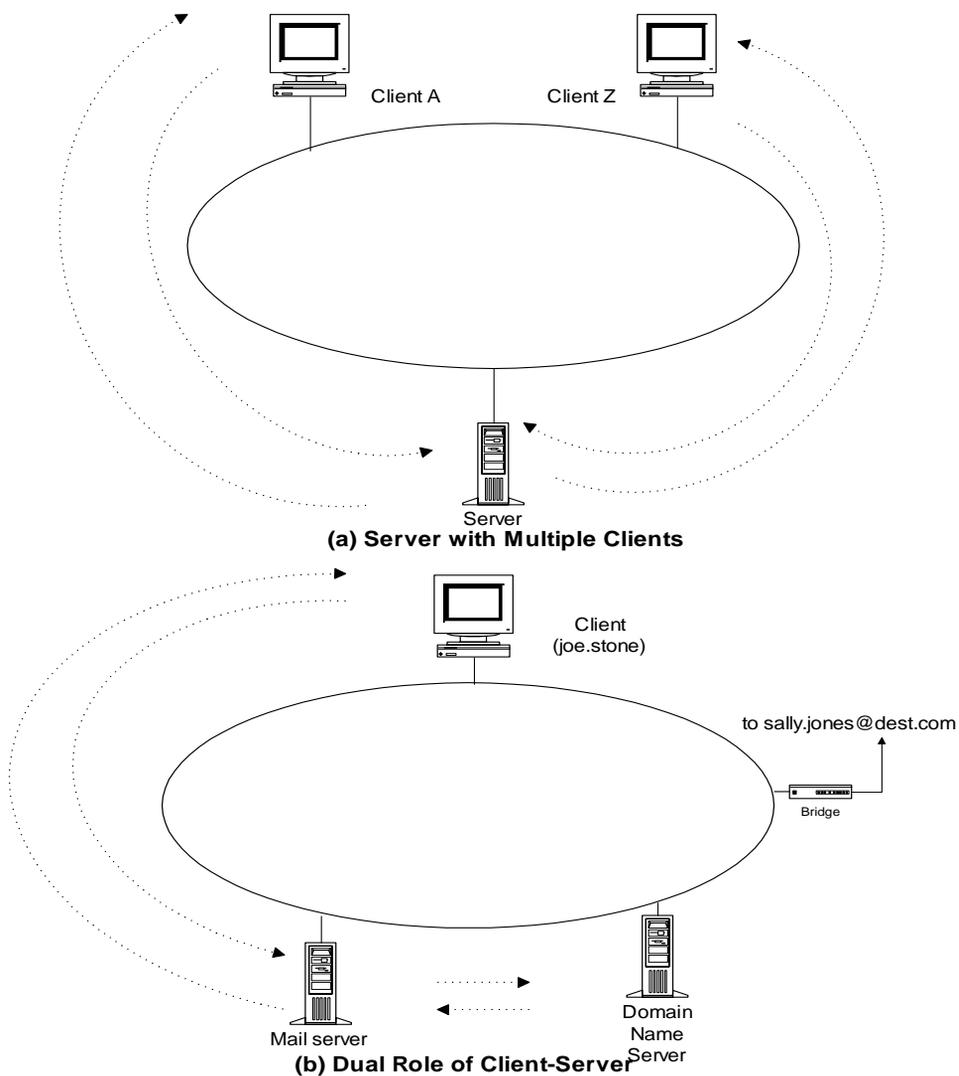

Figure 1.8 Client-Server in Distributed Computing Environment

## Notes

# TCP/IP Based Networks

- TCP/IP is a suite of protocols
- Internet is based on TCP/IP
- IP is Internet protocol at the network layer level
- TCP is connection-oriented transport protocol and ensures end-to-end connection
- UDP is connectionless transport protocol and provides datagram service
- Internet e-mail and much of the network mgmt. messages are based on UDP/IP
- ICMP part of TCP/IP suite

---

## Notes

# Internet Configuration

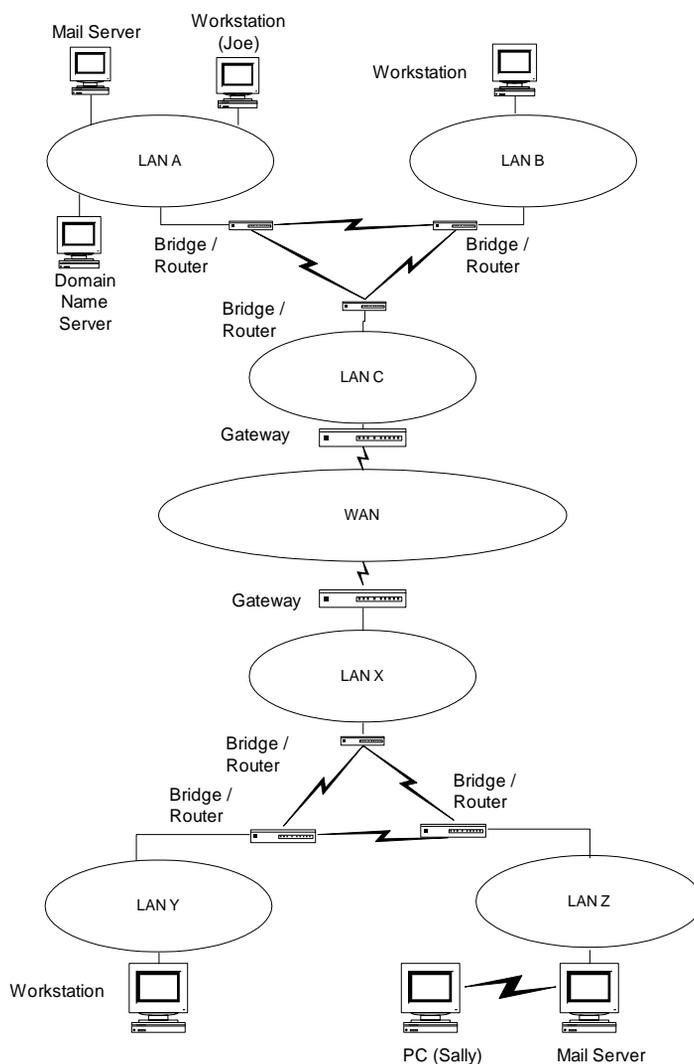

Figure 1.9 Internet Configuration

## Notes

- Walk through the scenario of e-mail from Joe to Sally

# Architecture, Protocols and Standards

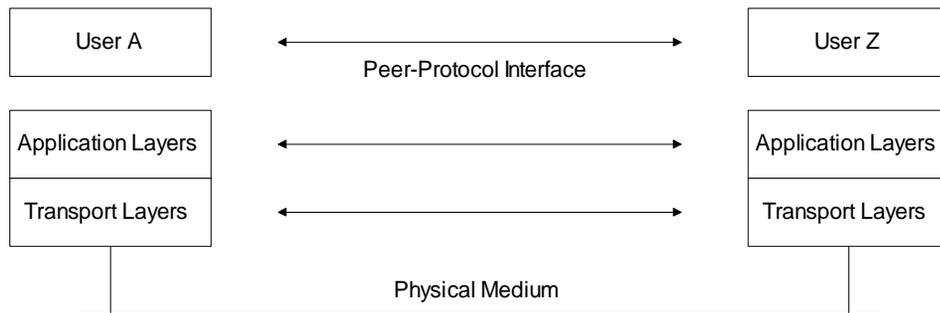

- Communication architecture
  - Modeling of communication systems, comprising
    - functional components and
    - operations interfaces between them
- Communication protocols
  - Operational procedures
    - intra- and inter-modules
- Communication standards
  - Agreement between manufacturers on protocols of communication equipment on
    - physical characteristics and
    - operational procedures

---

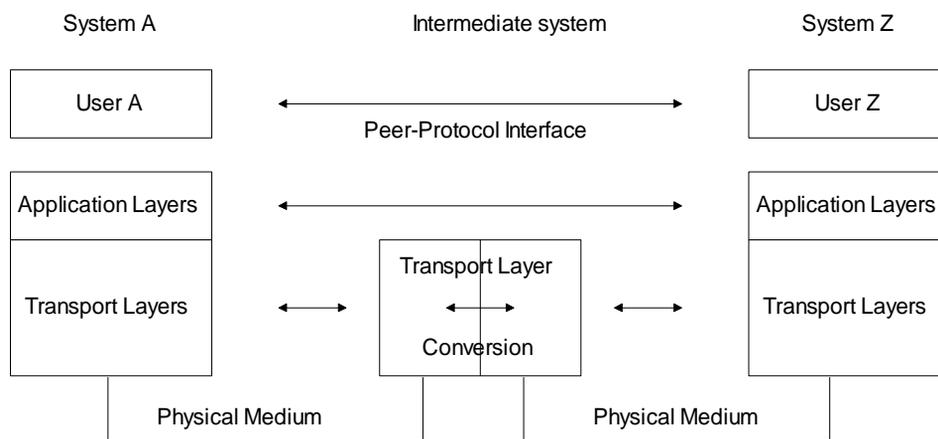

## Notes

- Examples: (Students to call out)

# Communication Architecture

(a) Direct Communication between End Systems

(b) Communication between End Systems via an Intermediate System

Figure 1.11 Basic Communication Architecture

## Notes

- Inter-layer interface: user and service provider
- Peer-layer protocol interface
- Analogy of hearing-impaired student
- Role of intermediate systems
- Gateway: Router with protocol conversion as gateway to an autonomous network or subnet

# OSI Reference Model

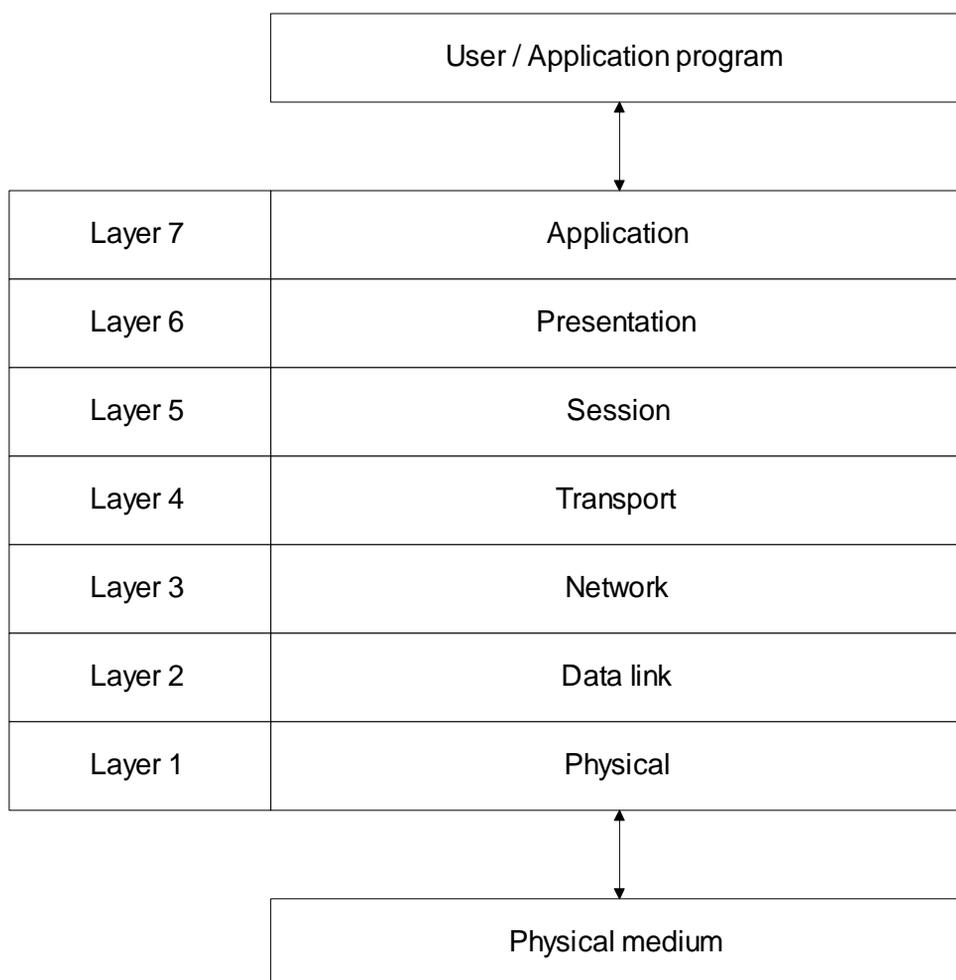

Figure 1.12 OSI Protocol Layers

## Notes

- Importance of the knowledge of layer structure in NM

# OSI Layers and Services

| Layer No. | Layer Name   | Salient services provided by the layer  |
|-----------|--------------|---|
| 1         | Physical     | -Transfers to and gathers from the physical medium raw bit data<br>-Handles physical and electrical interfaces to the transmission medium   |
| 2         | Data link    | -Consists of two sublayers: Logical link control (LLC) and Media access control (MAC)<br>-LLC: Formats the data to go on the medium; performs error control and flow control<br>-MAC: Controls data transfer to and from LAN; resolves conflicts with other data on LAN                     |
| 3         | Network      | Forms the switching / routing layer of the network  |
| 4         | Transport    | -Multiplexing and de-multiplexing of messages from applications<br>-Acts as a transparent layer to applications and thus isolates them from the transport system layers<br>-Makes and breaks connections for connection-oriented communications<br>-Flow control of data in both directions |
| 5         | Session      | -Establishes and clears sessions for applications, and thus minimizes loss of data during large data exchange   |
| 6         | Presentation | -Provides a set of standard protocols so that the display would be transparent to syntax of the application<br>-Data encryption and decryption  |
| 7         | Application  | -Provides application specific protocols for each specific application and each specific transport protocol system  |

## Notes

- Importance of services offered by different layers and the protocol conversion at different layers in NM

# PDU Communication Model

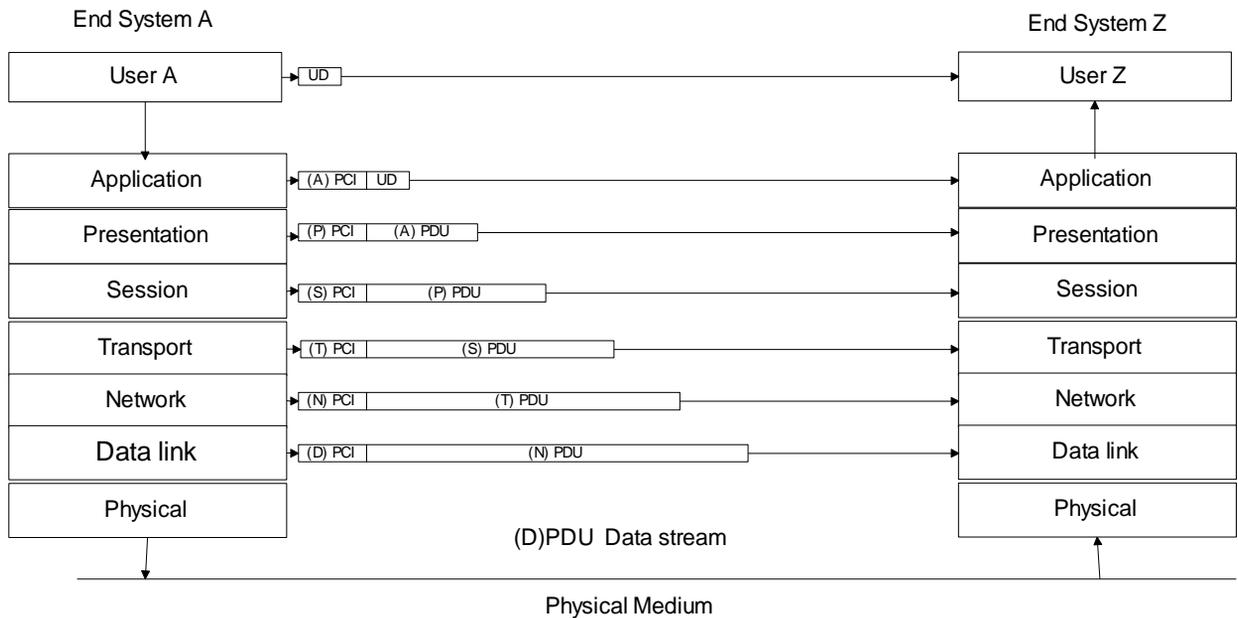

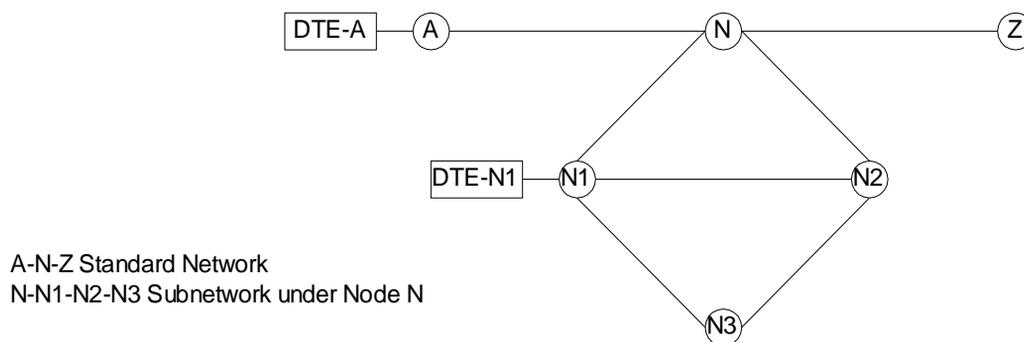

Figure 1.14 PDU Communication Model between End Systems

## Notes

- What is the relevance of PDU model in NM?

# Gateway

(a) Network configuration

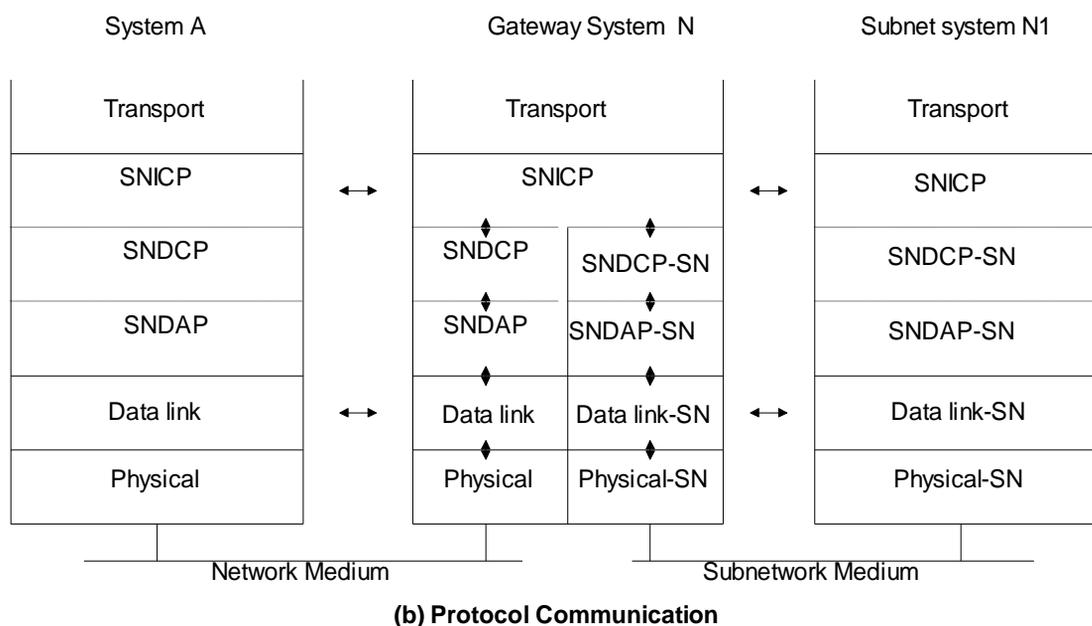

Figure 1.17 Gateway Communication to Proprietary Subnetwork

## Notes

- cc:mail from a station in Novel IPX network to an Internet station with SMTP e-mail

# SNA, OSI, and Internet

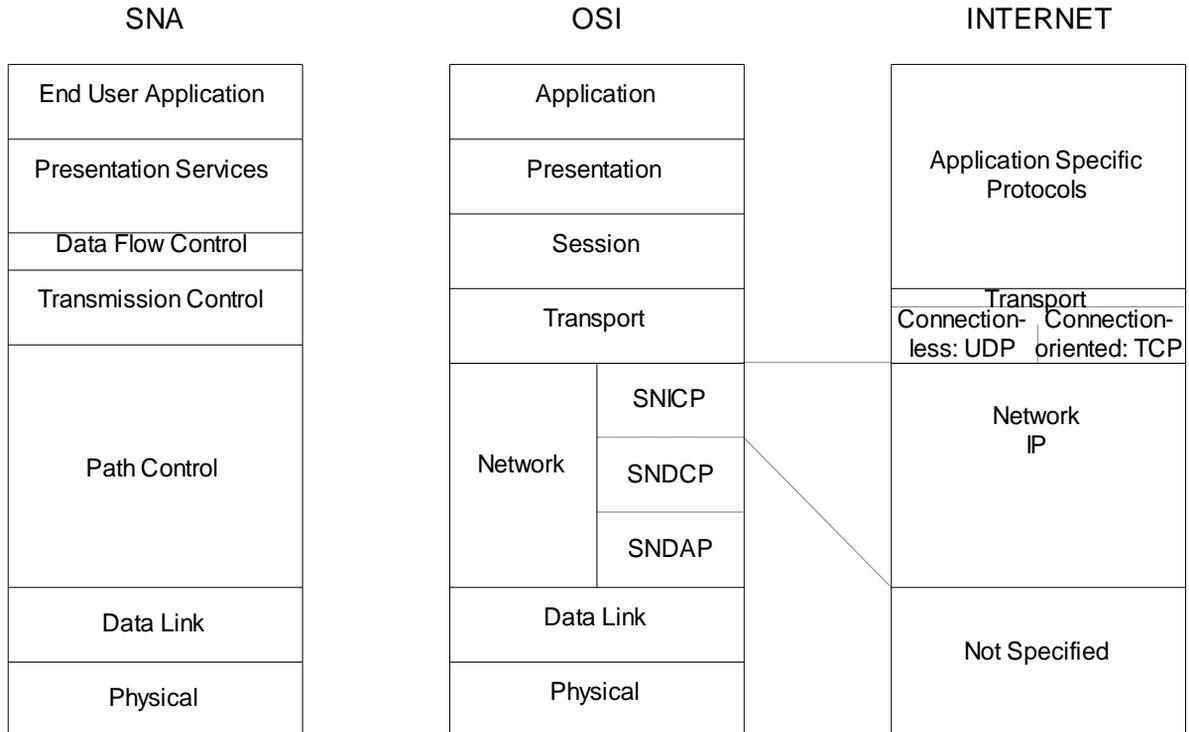

Figure 1.18 Comparison of OSI, Internet, and SNA Protocol Layer Models

## Notes

- Similarity between SNA and OSI
- Simplicity of Internet; specifies only layers 3 and 4
- Integrated application layers over Internet
- Commonality of layers 1 and 2 - IEEE standard

# Application Protocols

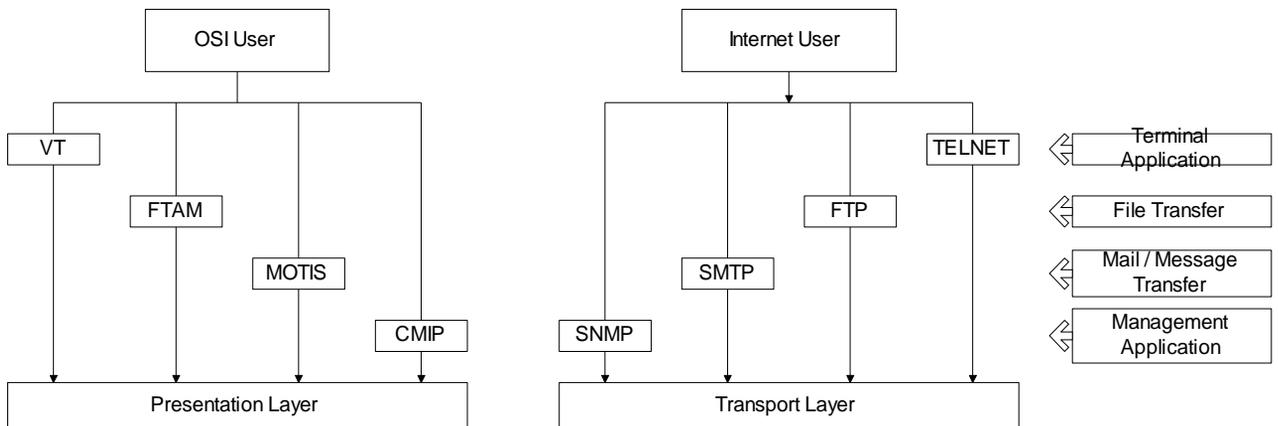

Figure 1.19 Application Specific Protocols in ISO and Internet Models

## Notes

| <b>Internet user</b>               | <b>OSI user</b>                            |
|------------------------------------|--|
| Telnet                             | Virtual Terminal                           |
| File Transfer Protocol             | File Transfer Access & Mgmt                |
| Simple Mail Transfer Protocol      | Message-oriented Text Interchange Standard |
| Simple Network Management Protocol | Common Management Information Protocol     |

# NM Case Histories

- The case of the Footprint
- Case of the crashing bridge

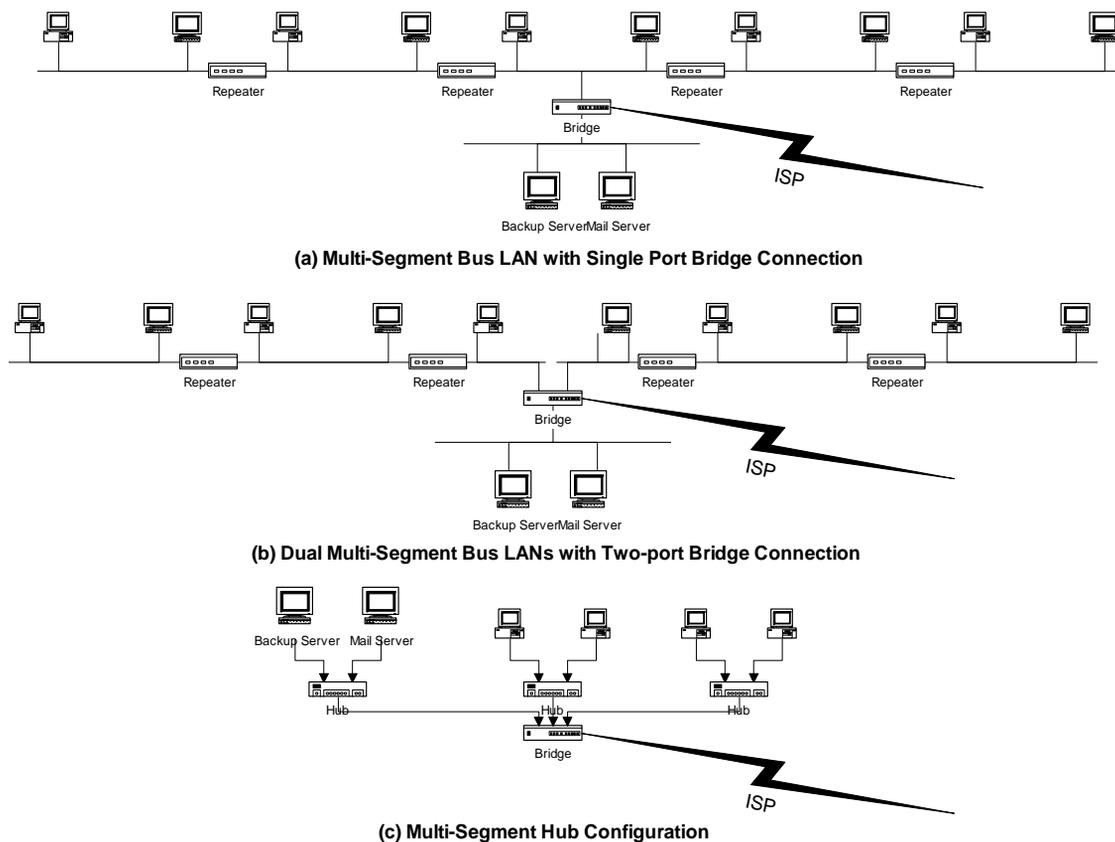

Figure 1.20 Case History 2: Network Configuration Evolution

## Notes

# Common Network Problems

- Loss of connectivity
- Duplicate IP address
- Intermittent problems
- Network configuration issues
- Non-problems
- Performance problems

---

## Notes

# Challenges of IT Managers

- Reliability
- Non-real time problems
- Rapid technological advance
- Managing client/server environment
- Scalability
- Troubleshooting tools and systems
- Trouble prediction
- Standardization of operations - NMS helps
- Centralized management vs “sneaker-net”

---

## Notes

# Network Management

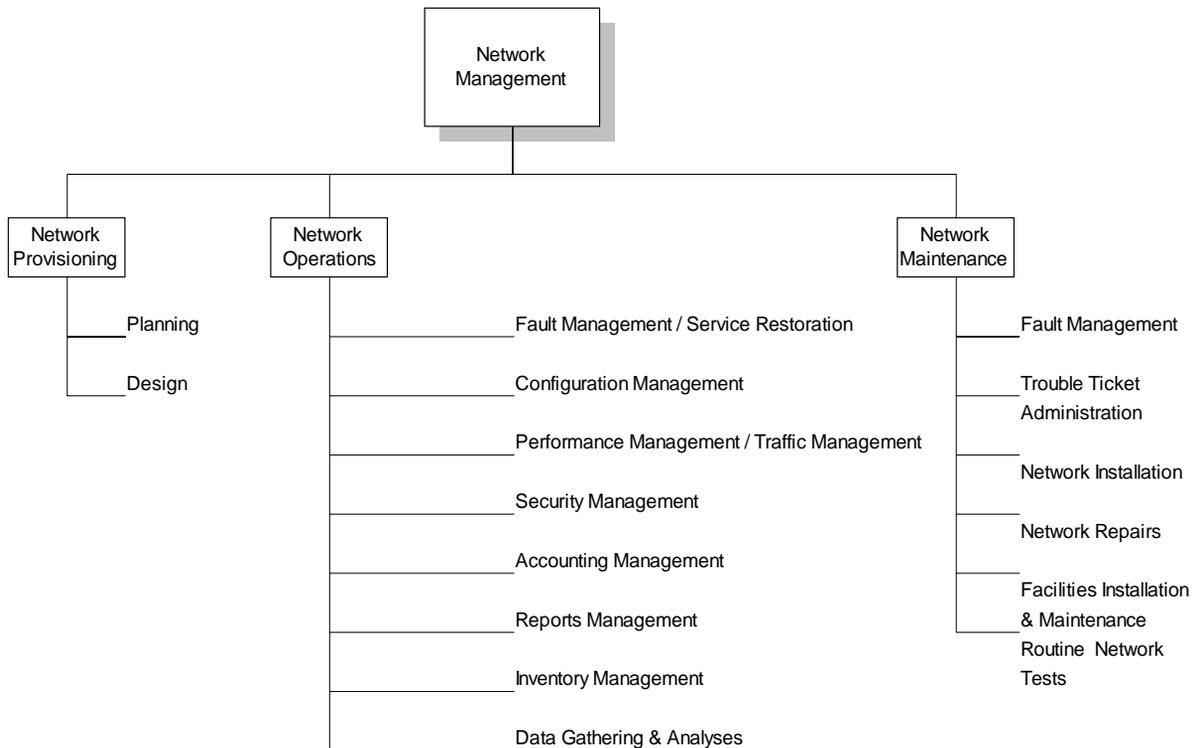

Figure 1.21 Network Management Functional Groupings

## Notes

- OAM&P
  - Operations
  - Administration
  - Maintenance
  - Provisioning

# NM Functional Flow Chart

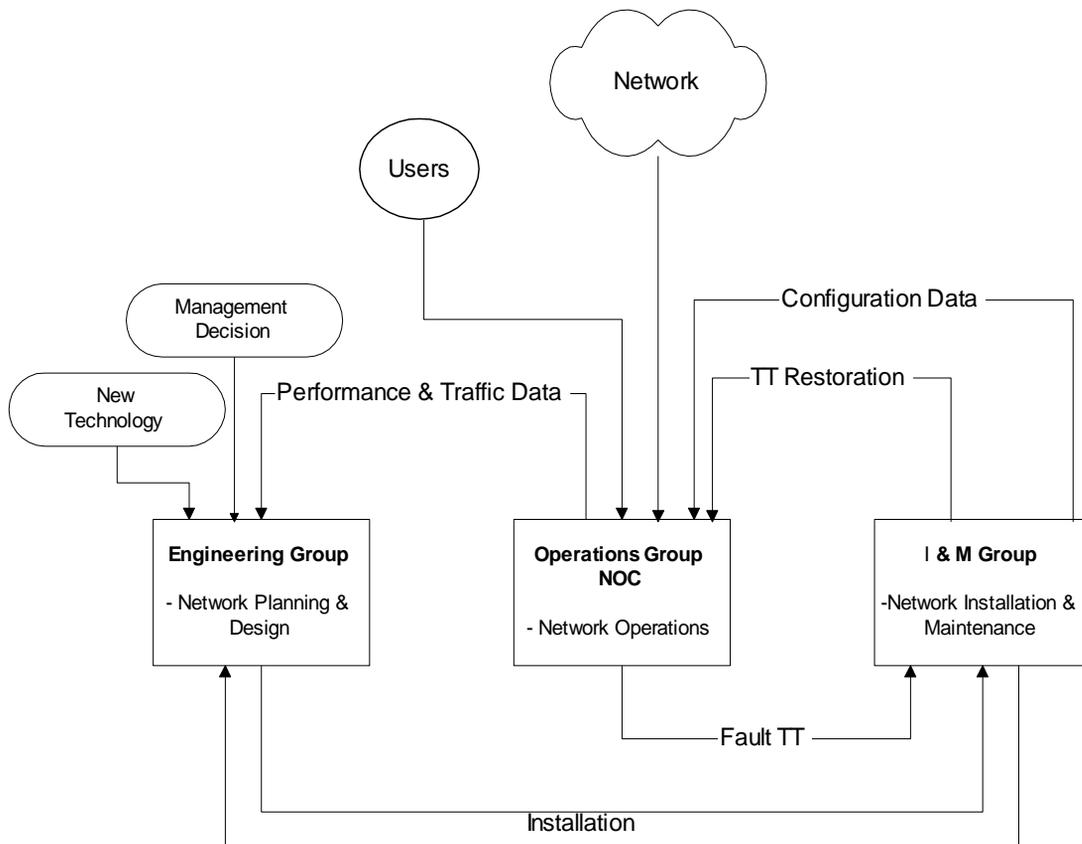

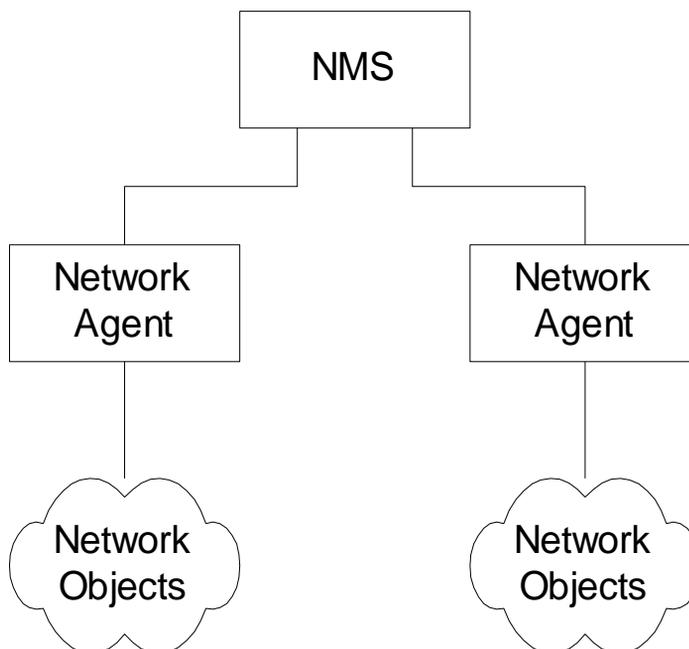

Figure 1.22. Network Management Functional Flow Chart

## Notes

---

# NM Components

**Figure 1.24 Network Management Components**

---

## Notes

# Interoperability

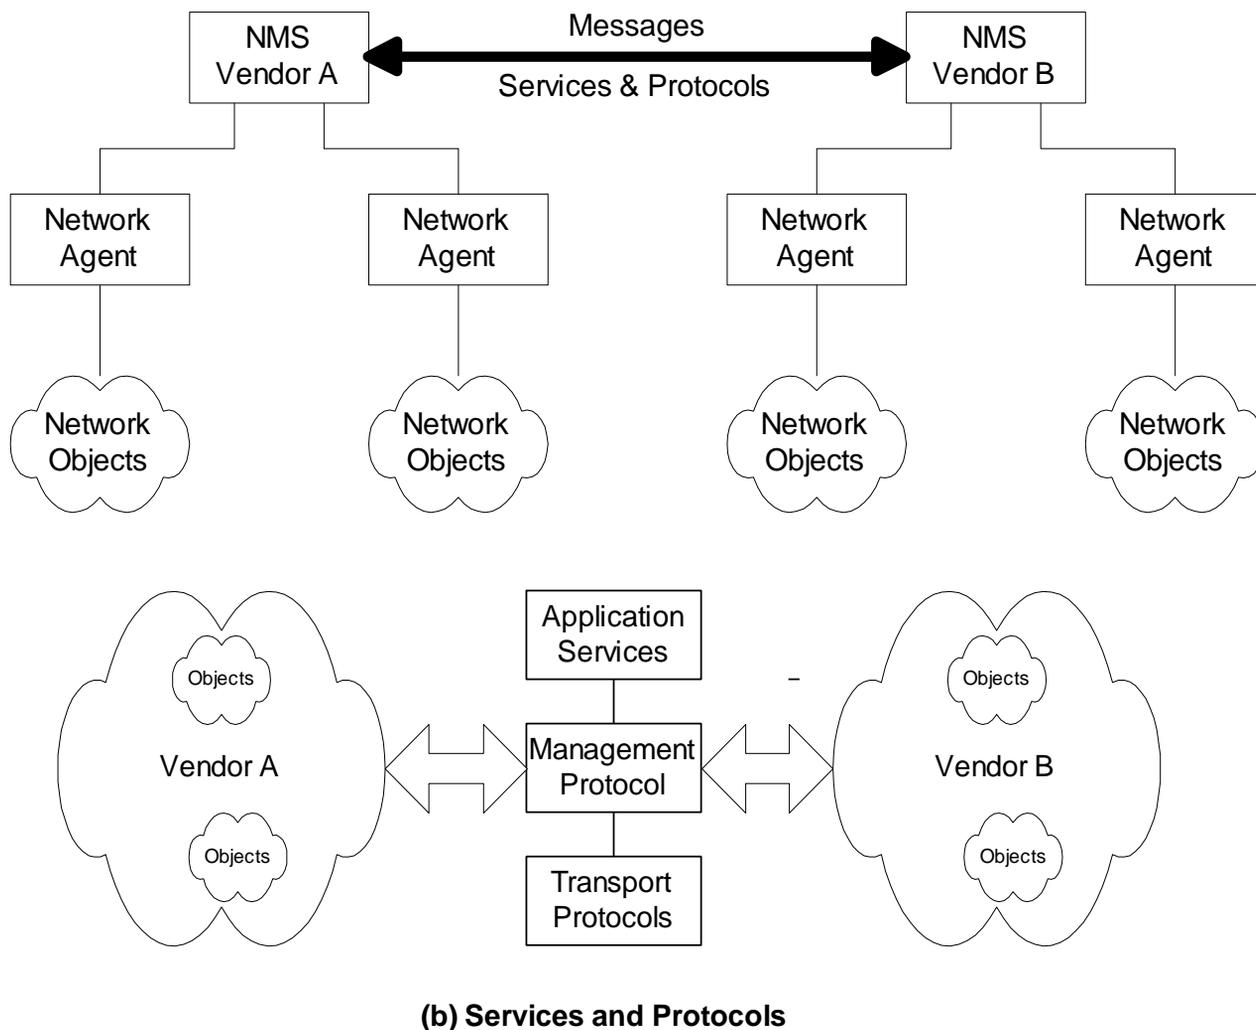

Figure 1.23 Network Management Dumbbell Architecture

## Notes

- Message exchange between NMSs managing different domains

# Status and Future Trends

- Status:
  - SNMP management
  - Limited CMIP management
  - Operations systems
  - Polled systems
- Future trends:
  - Object-oriented approach
  - Service and policy management
  - Business management
  - Web-based management

---

## Notes

# Chapter 2

## Computer Network Technology

# Technology and Management

- What are the technologies that need to be managed?
- Challenges of technological progress on network management

---

## Notes

# Computer Network Technology

- Network comprises
  - Nodes
  - Links
- Topology: How they're configured
  - LAN
  - WAN

---

## Notes

- Distinction between LAN and WAN

# LANs

- Type of LANs
  - Ethernet
  - Fast Ethernet
  - Gigabit Ethernet
  - Half-duplex Vs Full-duplex
  - Switched Ethernet
  - VLAN
  - Token ring
  - FDDI
  - ATM / LANE

---

## Notes

# Nodes

- Hubs
- Bridges
- Remote bridges
- Routers
- Gateways
- Half bridge / half router
- Switches

---

## Notes

# WANs

- Facilities / Media
  - Wired
    - Copper
    - Coaxial
    - Fiber
  - Wireless
    - Terrestrial
    - Satellite
- Mode
  - Digital
  - Analog
- Services
  - POTS
  - ISDN
  - Broadband

---

## Notes

# Basic LAN Topologies

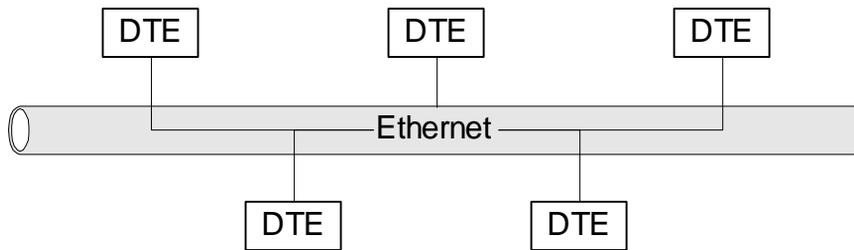

Figure 2.1(a) Bus Topology

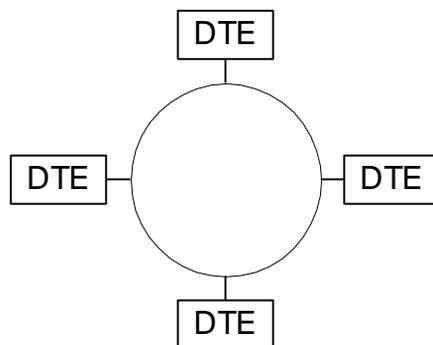

Figure 2.1(b) Ring Topology

## Notes

- Bus topology
  - Used in Ethernet LAN family
  - Common shared medium
  - Randomized access (CSMA/CD)
  - Easy to implement
  - Lower utilization under heavy traffic 30%-40%
  - Single culprit could effect the entire LAN

# Basic LAN Topologies

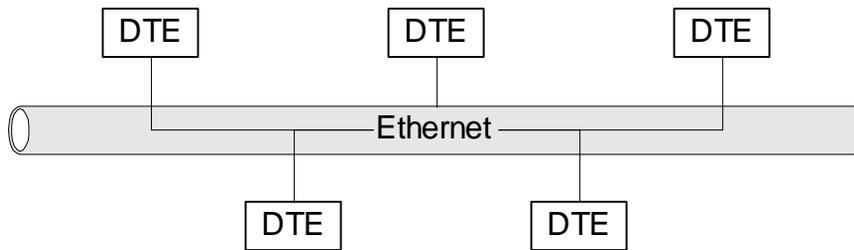

Figure 2.1(a) Bus Topology

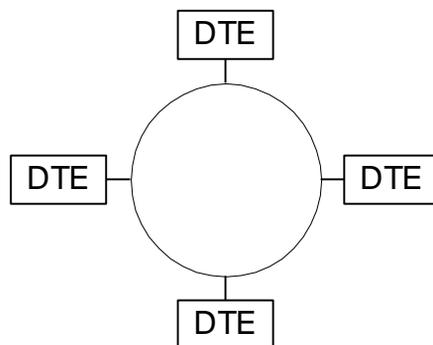

Figure 2.1(b) Ring Topology

## Notes

- Ring Topology
  - Used in token ring and FDDI
  - Shared medium
  - Deterministic access
  - Master DTE has control
  - High utilization >90%

# Star & Hybrid LAN Topologies

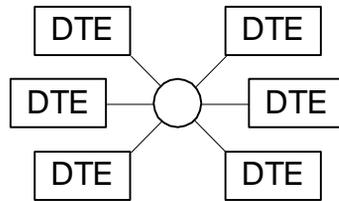

Figure 2.1(c) Star Topology

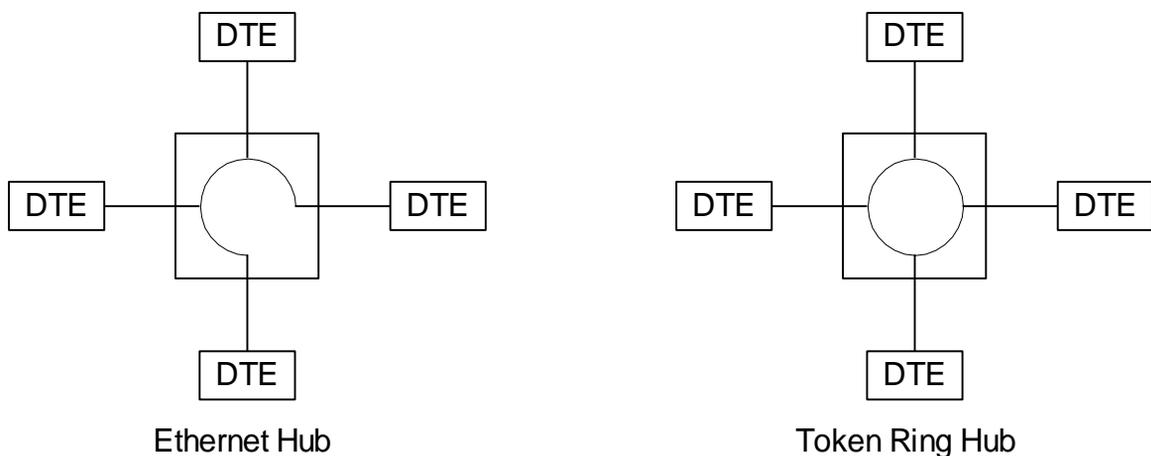

Figure 2.1(d) Hub Configurations

## Notes

- Star topology used with bus and ring topology
- Hub is “LAN in a box”
- What does the electronic LAN inside the box look like?
- Why has hub become so popular?

# A Campus Network

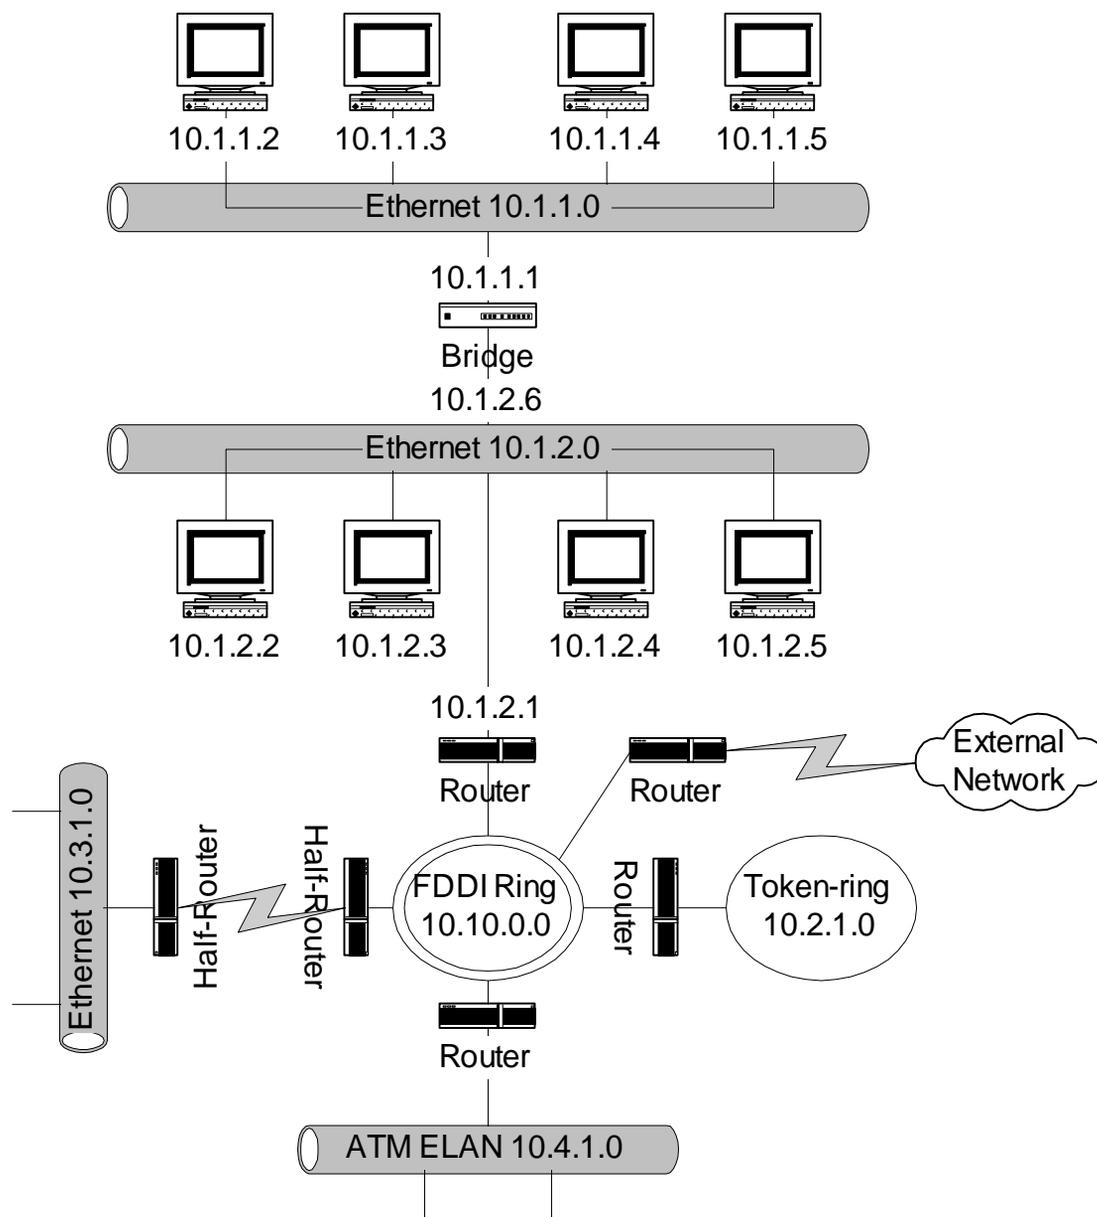

Figure 2.3 Campus Network of LANs

## Notes

- ATM VLAN an alternative to FDDI backbone

# WAN Topologies

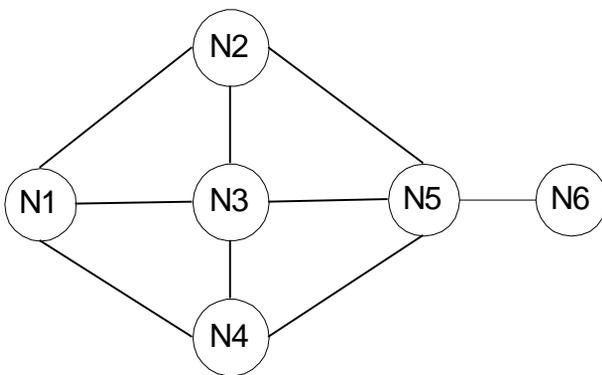

Figure 2.2(a) Mesh Topology

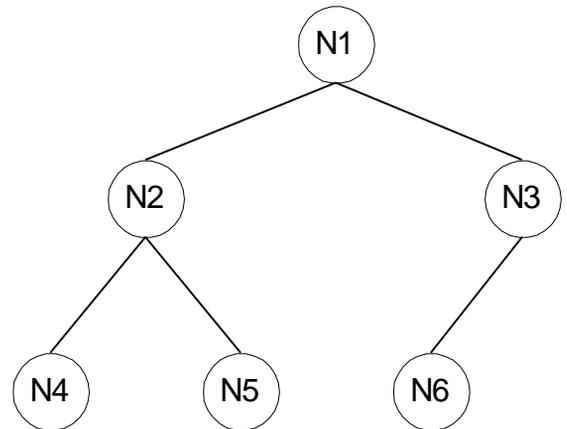

Figure 2.2(b) Tree Topology

## Notes

- Mesh topology
  - Implemented in network layer level
  - Multiple paths between nodes
  - Flat topology
  - Redundancy
  - Load balancing
  - Shortest path
- Tree topology
  - Used with Ethernet bridges
  - Hierarchical
  - Efficient for small networks and special purpose networks

---

# Ethernet

**Table 2.1 Ethernet LAN Topology Limits**

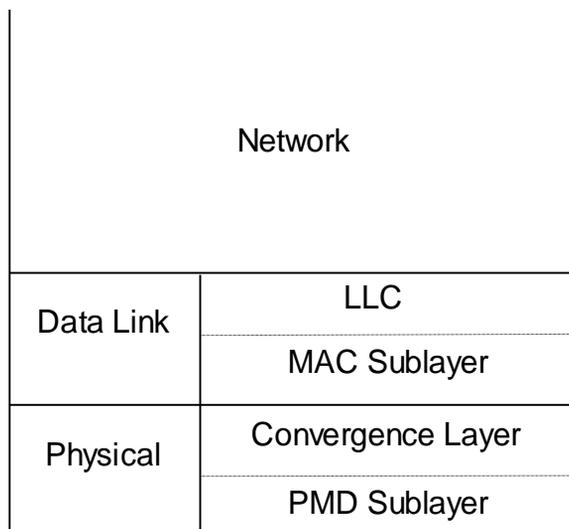

| TYPE     | DESCRIPTION       | SEGMENT LENGTH | DROP CABLE               |
|----------|-------------------|----------------|--------------------------|
| 10Base2  | Thin coax (0.25") | 200 meters     | Not allowed              |
| 10Base5  | Thick Coax (0.5") | 500 meters     | Twisted pair: 50 meters  |
| 10Base-T | Hub topology      | N/A            | Twisted pair: 100 meters |
| 10Base-F | Hub topology      | N/A            | 2 km                     |

---

## Notes

- IEEE 802.3 standard
- 10 Mbps data rate
- Collision - analogy of hollow pipe
- Principle of operation; CSMA/CD
- Segment length and drop cable length
- Minimum size of packet 64 bytes
- Maximum size of packet 1500 bytes
- Hub configuration

# Fast Ethernet

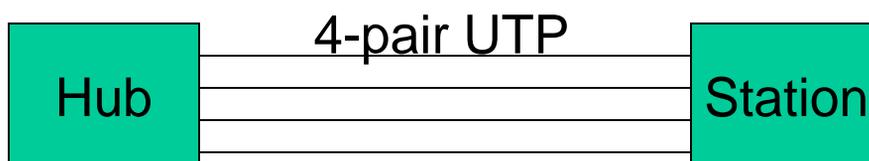

LLC Logical Link control

MAC Medium Access Control

PMD Physical Medium Dependent

**Figure 2.4 100Base-T Fast Ethernet Protocol Architecture**

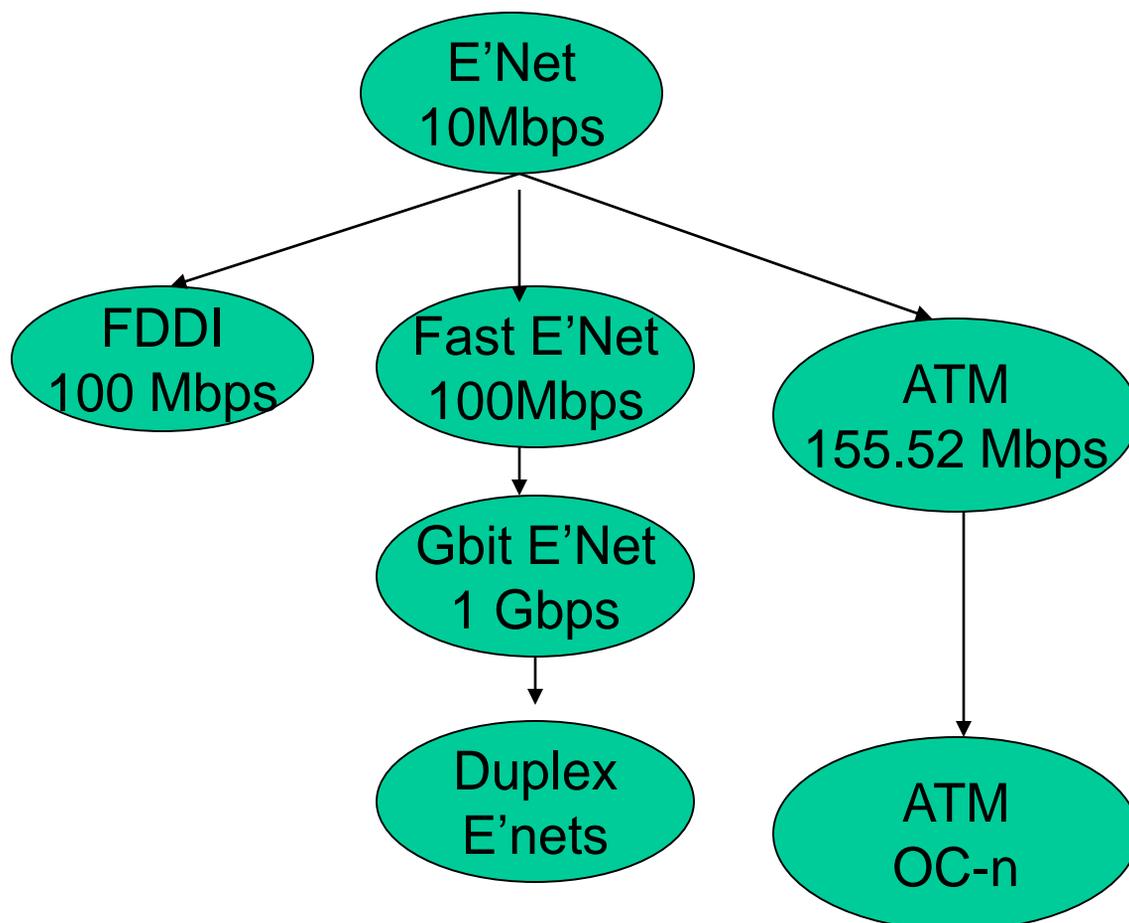

## Notes

- Rationale
  - Max drop length 100m => Max round-trip time 1/10 of Ethernet; hence 10 times data rate
- Standard 100Base-T4
- Compatibility with 10BaseT
- UTP limitation; Use 4-pair UTP @ 25 Mbps/pair
- Alternatives: 2-pair 100BaseTX Cat 5(Max 100 m) and 100Base FX optical fiber (Max 2 km)

---

# LAN Data Rate Race

---

## Notes

# Gigabit Ethernet

**Table 2.2 Gigabit Ethernet Topology Limits**

|             | 9<br>micron<br>Single-<br>Mode | 50<br>micron<br>Single<br>Mode | 50 micron<br>Multimode | 62.5<br>micron<br>Multimode | Balance<br>Shielded<br>Cable | UTP   |
|-------------|--------------------------------|--------------------------------|------------------------|-----------------------------|------------------------------|-------|
| 1000BASE-LX | 10 km                          | 3 km                           | 550 m                  | 440 m                       | -                            | -     |
| 1000BASE-SX | -                              |                                | 550 m                  | 260 m                       | -                            | -     |
| 1000BASE-CX | -                              |                                | -                      | -                           | 25 m                         | -     |
| 1000BASE-T  | -                              |                                | -                      | -                           | -                            | 100 m |

## Notes

- Packet size 512 bytes, slot size 4.096 microseconds
- Minimum frame size 64 bytes for backward compatibility; Slot filled with carrier extension
- Packet bursts with no idle time between frames increases efficiency

---

# Switched Ethernet

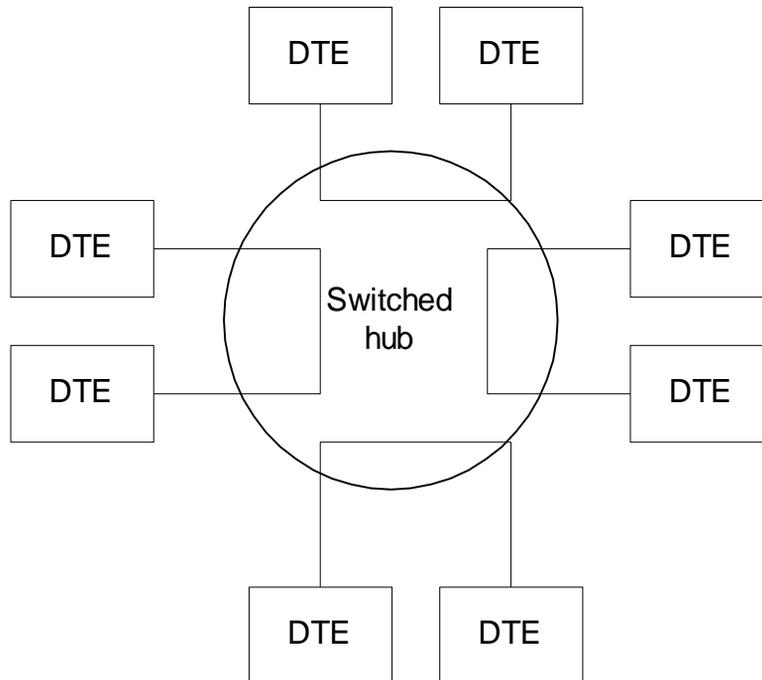

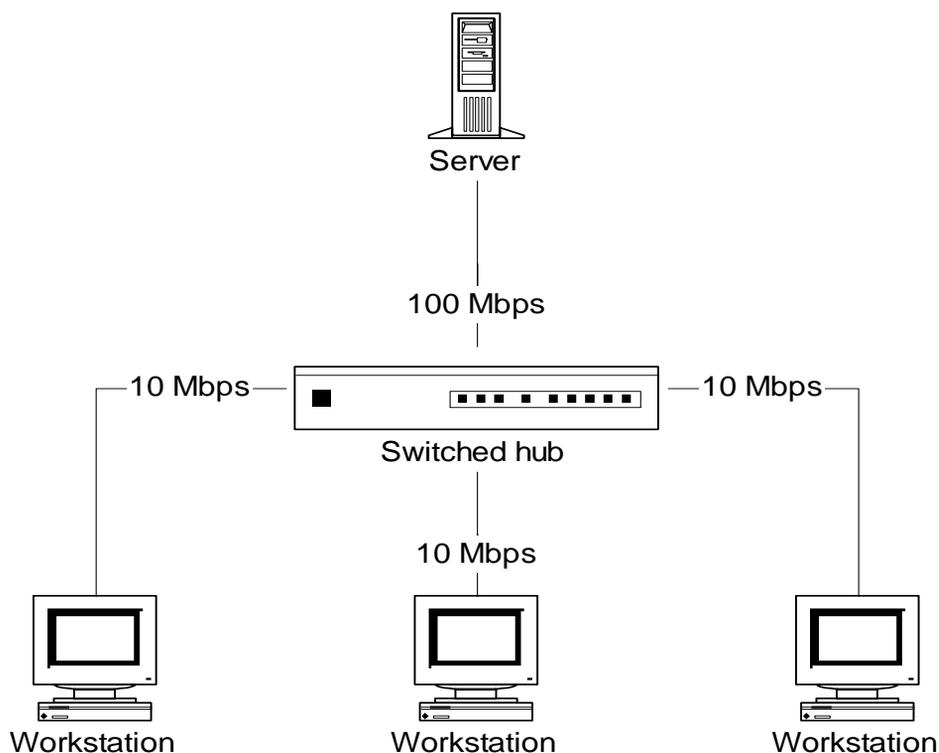

Figure 2.8 Switched Ethernet Hub

---

## Notes

- Maximum throughput increased  $\sim N/2$  in N-port hub
- Snooping capability lost for management

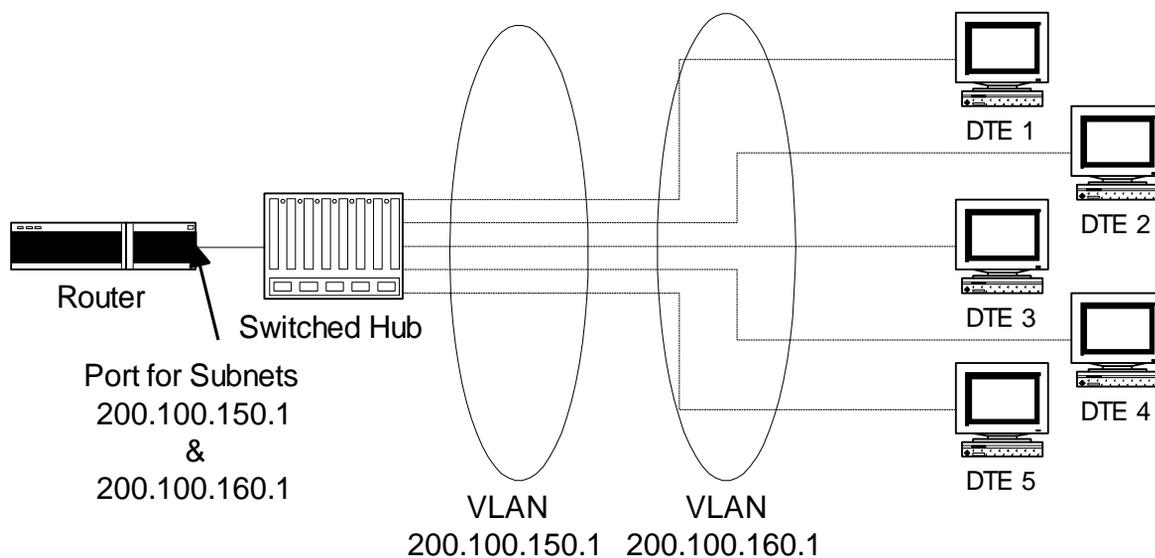

# Client/Server Configuration using Switched Hub

**Figure 2.9 Switched Hub in Client-Server Configuration**

## Notes

# Virtual LAN

**Figure 2.10 Virtual LANs**

## Notes

- Switched hub enables establishing virtual LANs
- Permits switching stations between LANs without physical moving of equipment
- Walk through scenario

# Token Ring

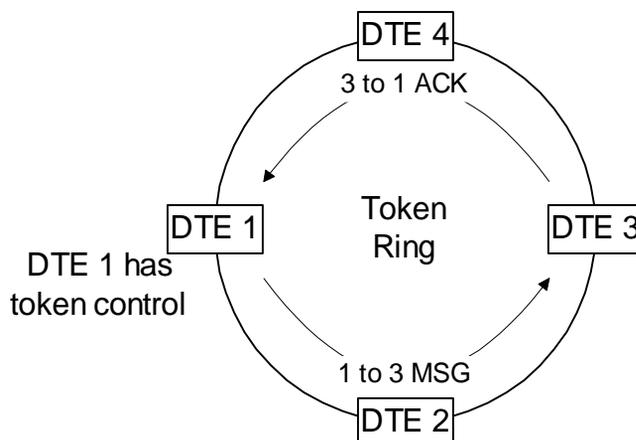

Figure 2.11 Token Ring LAN

## Notes

- Adopted by IBM
- IEEE 802.5 standard
- Data rates of 4Mbps and 16 Mbps
- Single and dual ring LANs

---

# Dual Ring TR LAN

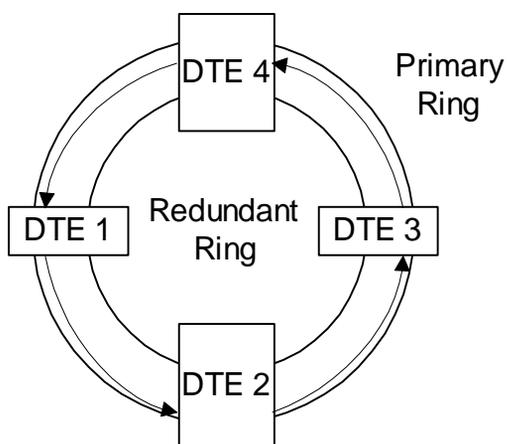

Figure 2.12(a) Token Ring Dual Ring Management

---

## Notes

# Failure Recovery in TR LAN

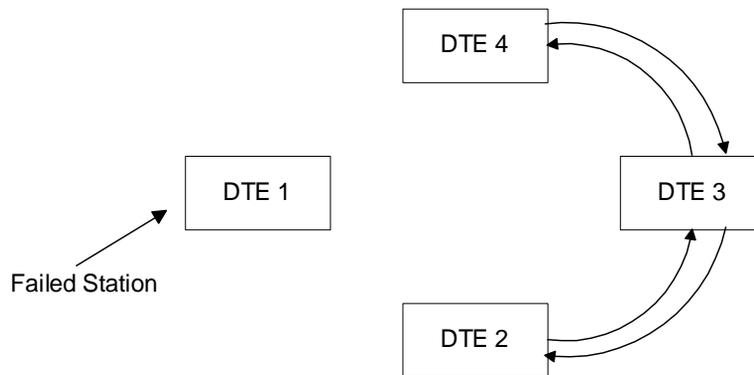

Figure 2.12(b) Token Ring DTE Isolation

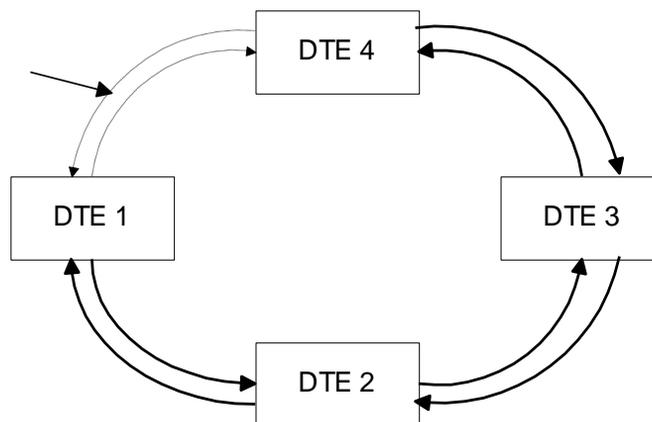

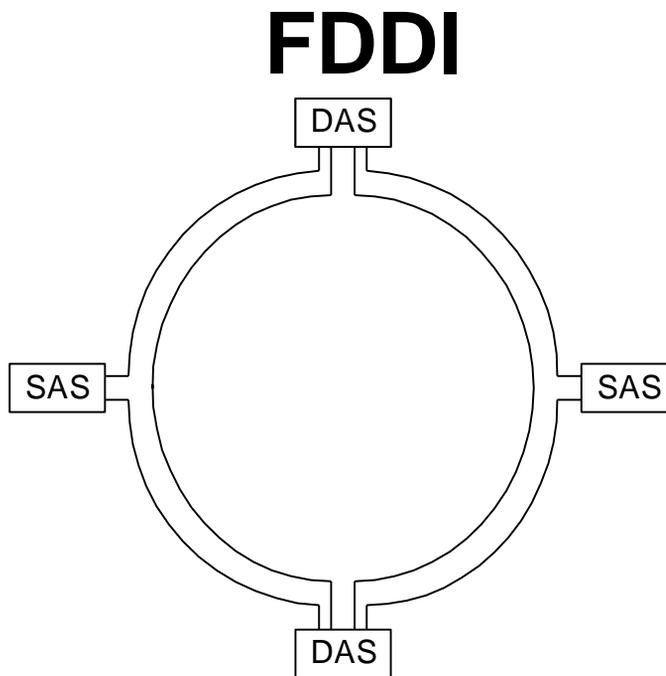

Figure 2.12(c) Token Ring Segment Isolation

## Notes

- Station failure recovery
- Link failure recovery

SAS Single Attached Station  
DAS Dual Attached Station

**Figure 2.13(a) Dual Ring FDDI Network Configuration**

## Notes

- Uses fiber optics medium
- Modified token ring protocol
- Data rate 100 Mbps
- Segment length 100 km
- 500 stations in the ring with max separation of 2 km
- Single and dual attached stations
- Dual attached stations load share the two rings

# Basic Network Nodes

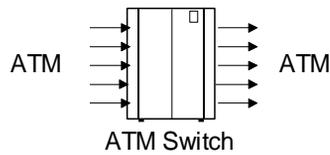

Figure 2.14(a) Switch

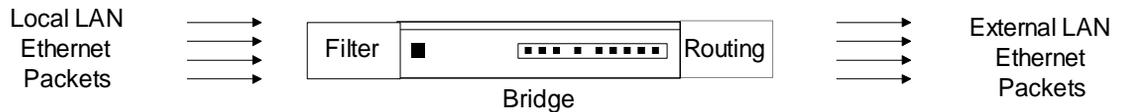

Figure 2.14(b) Bridge

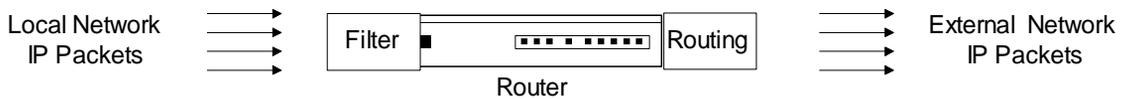

Figure 2.14(c) Router

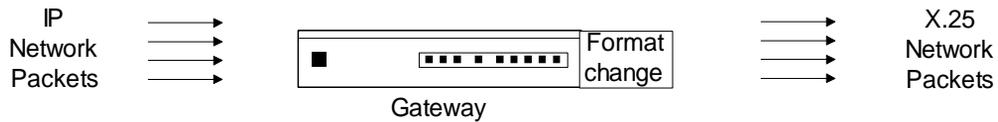

Figure 2.14(d) Router

Figure 2.14 Basic Network Node Components

## Notes

# Network Node Components

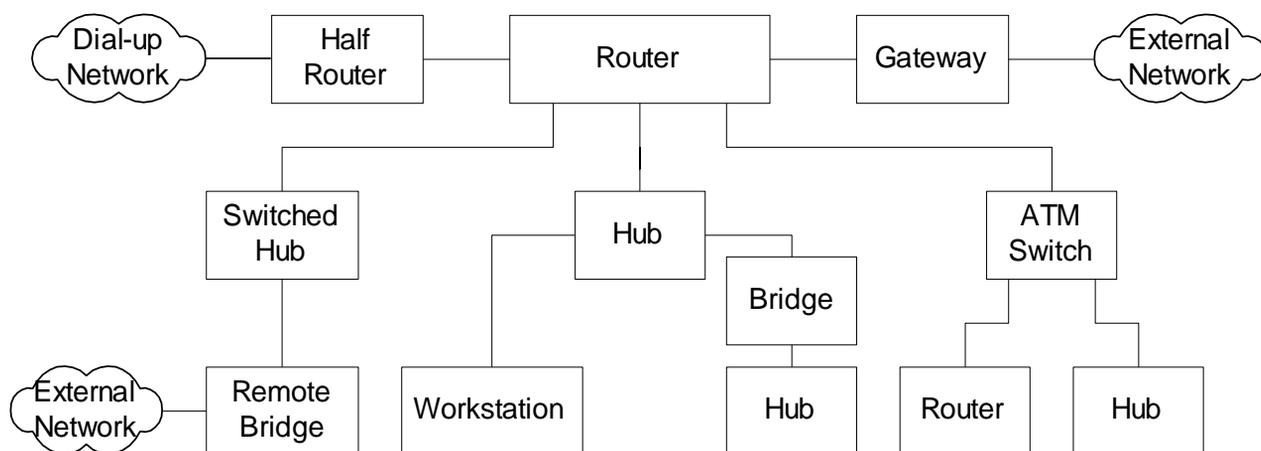

Figure 2.15 Networked Components

## Notes

- Hubs
- Bridges
- Remote bridges
- Routers
- Gateways
- Half bridge / half router
- Switches

# Hubs

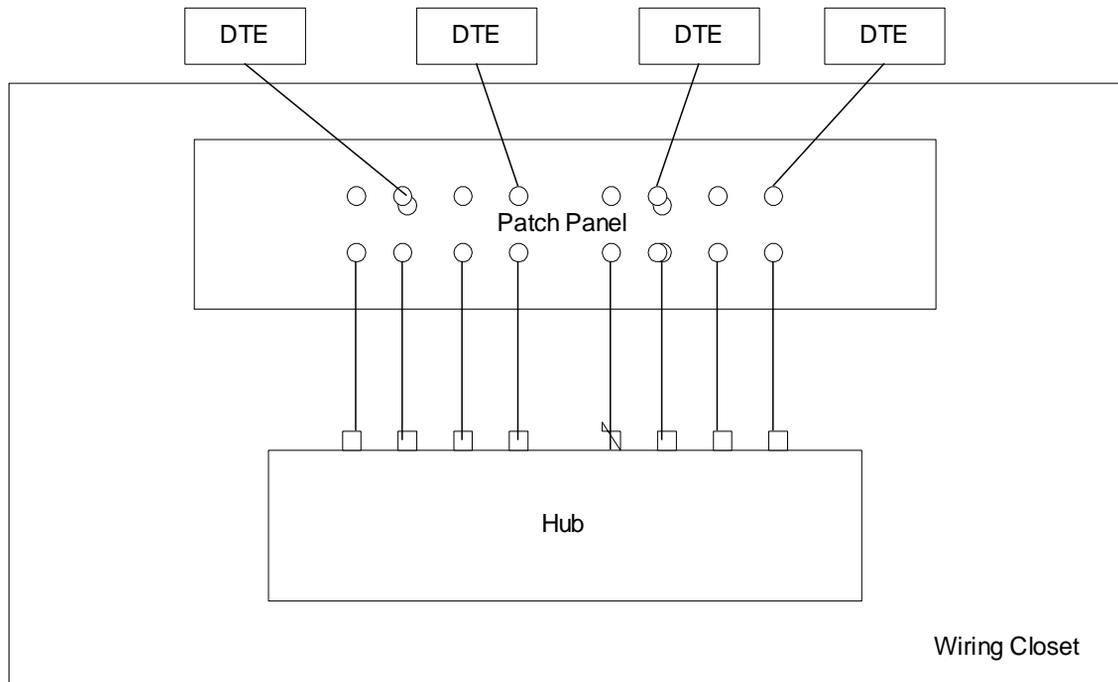

Figure 2.16(a) Hub Configuration

## Notes

- Hub is a platform
- Function dependent on what is housed
  - LAN
  - Switched LAN
  - Bridge

# Stacked Hubs

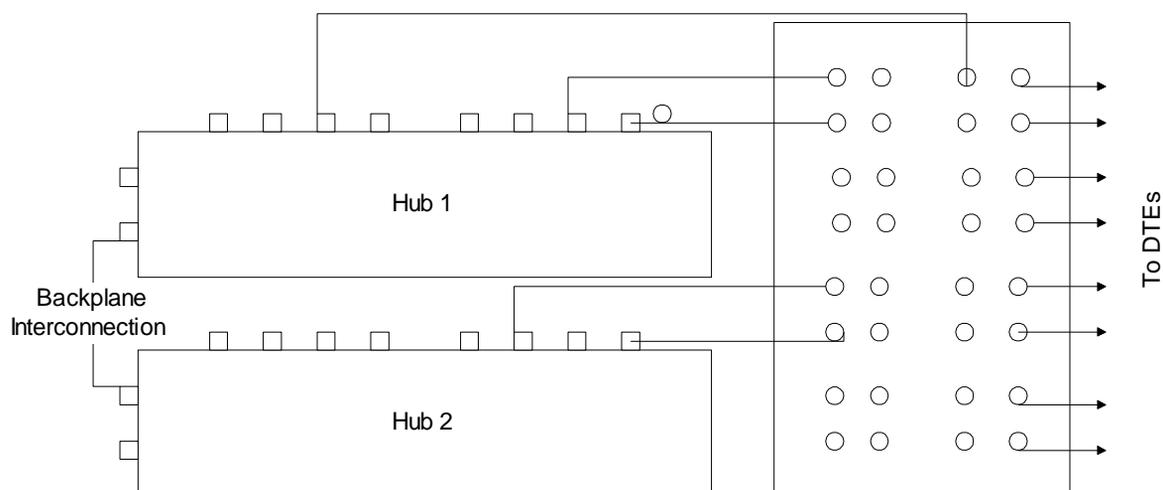

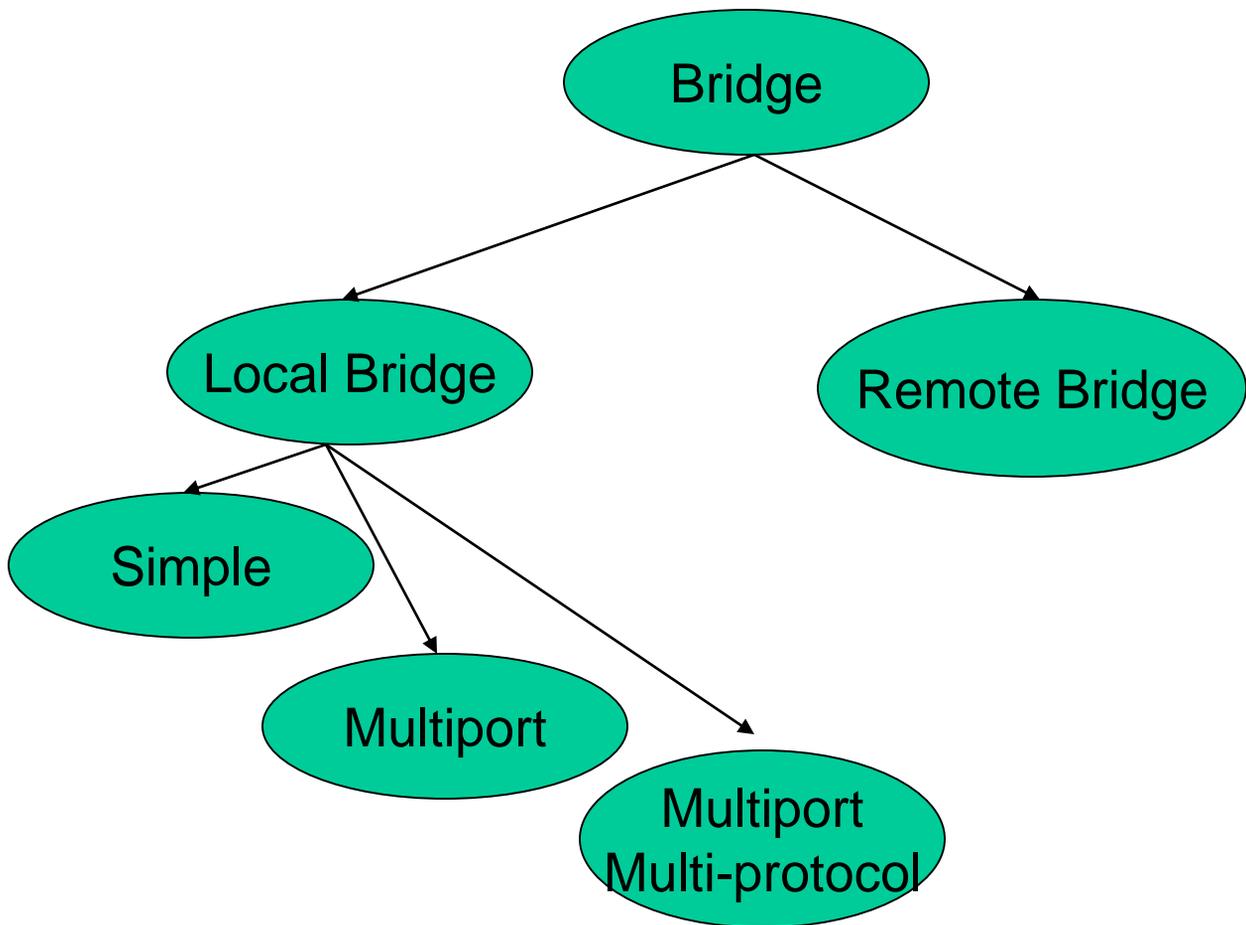

Figure 2.16(b) Stacked Hub

## Notes

- Hub ports can be scaled up using stacked hubs
- Stacked hub
  - extend back plane
  - connected as daisy chain

---

# Bridges

---

## Notes

- Bridges two nodes at data link control layer
  - Ethernet: tree topology, transparent bridge
  - Token ring: mesh topology, source routing bridge
- Remote bridge uses WAN interface cards; same protocol used at both ends
- Ethernet bridge is a learning bridge

# Routers

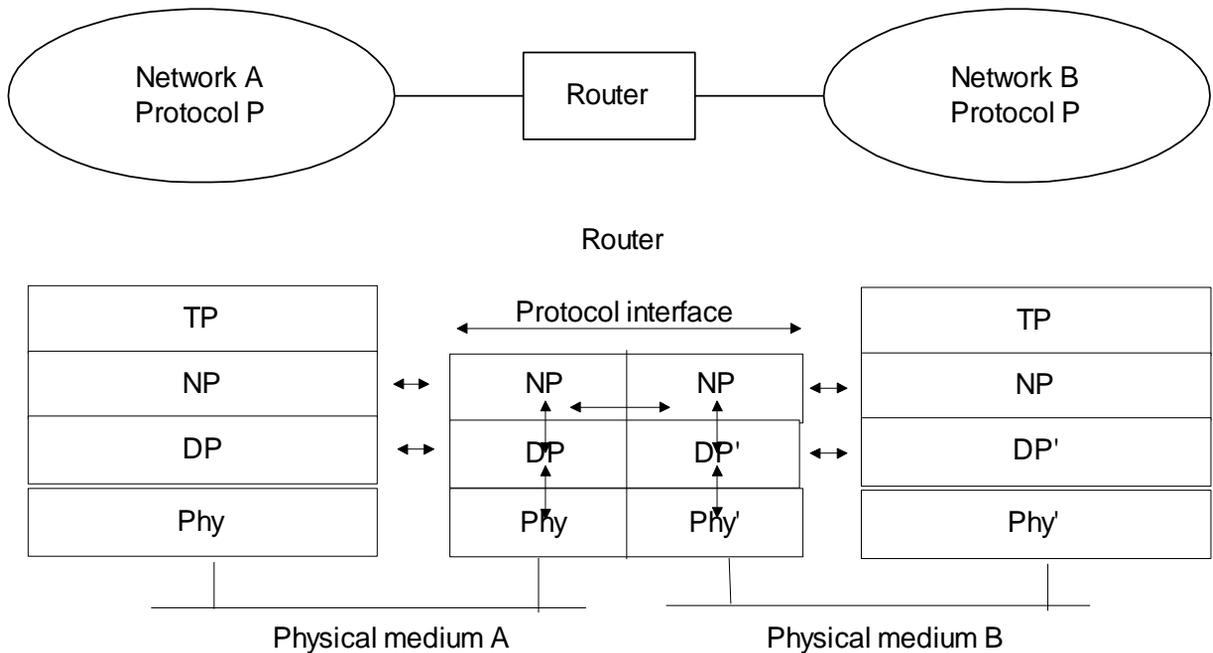

Figure 2.21 Router Configuration

## Notes

- Routers operate at network layer
- Routes packets between nodes of similar network protocols
- Routing table used to route packets
- DLC and Physical layers could be different under the same common network layer protocol

# Gateway

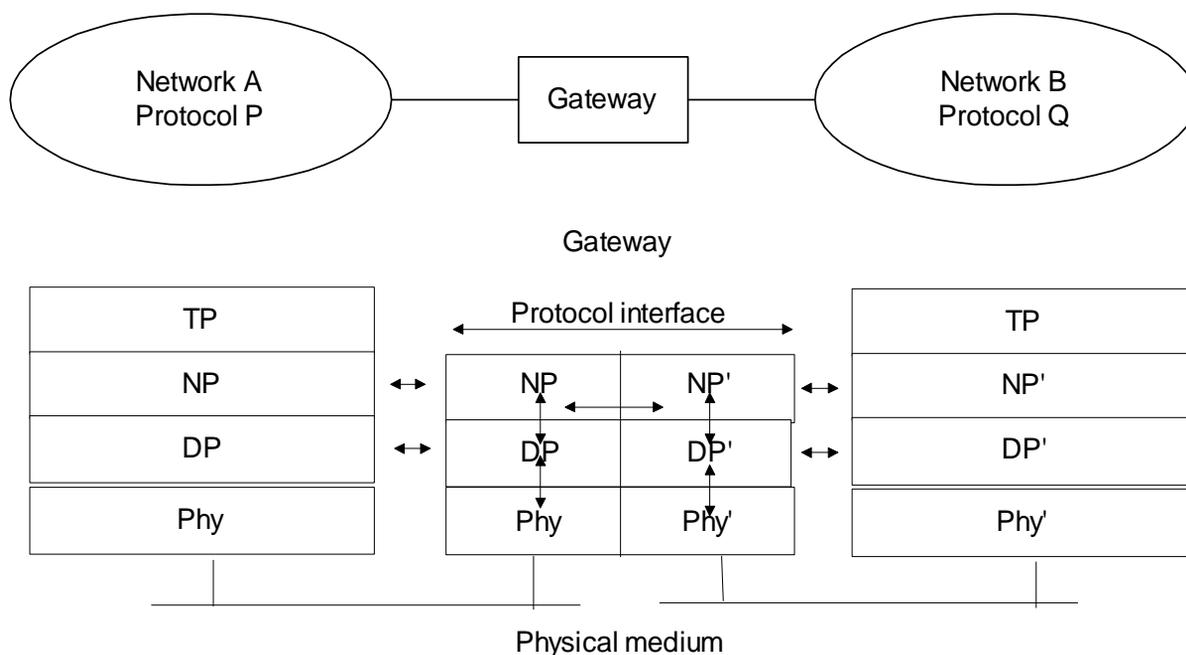

Figure 2.22 Gateway Configuration

## Notes

- Gateway is router connecting two networks with dissimilar network protocols
- Gateway does the protocol conversion at the network layer
- Protocol converter does the conversion at the application layer

# Tunneling

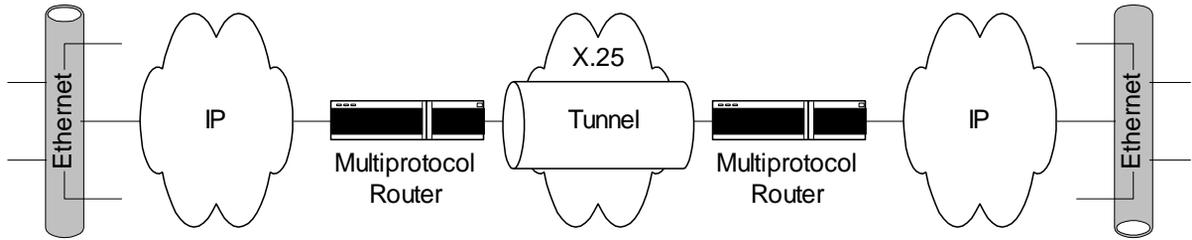

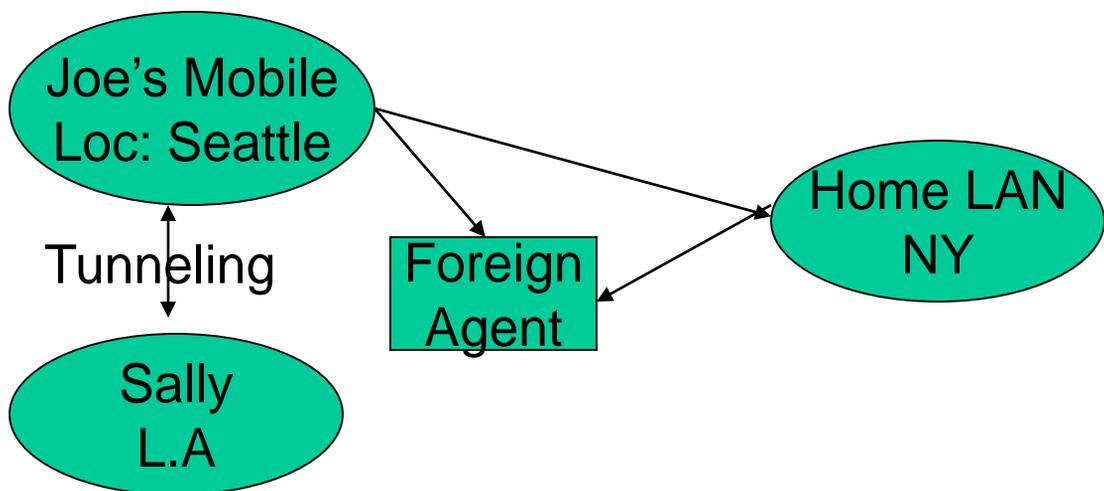

Figure 2.24 Tunneling Using Multiprotocol Routers

## Notes

- Tunneling is transmission of packets (via multiprotocol routers) by encapsulation
- In Figure 2.24, packets are encapsulated and transmitted through X.25 network in a serial mode
- In the mobile environment, Joe and his home agent in NY communicate Joe's Seattle location to the foreign agent. His communication with Sally in LA is tunneled

# Half-Bridge

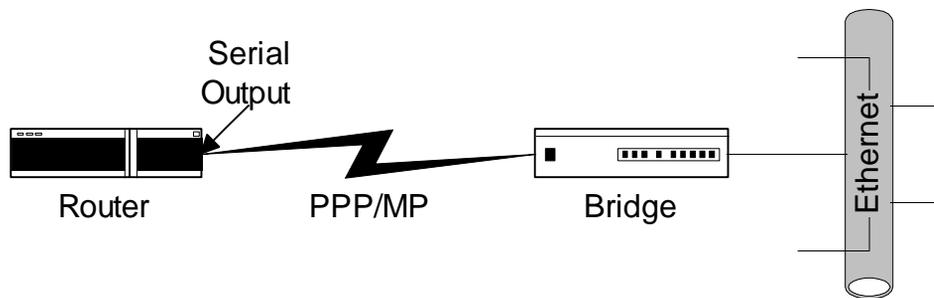

Figure 2.25 Half-Bridge Configuration

## Notes

- Half-bridge (also referred to as half-router) is point-to-point communication
- Uses PPP protocol
- Helps low-end users to communicate with ISP on dial-up link saving the expense of dedicated link
- Router encapsulates packets in PPP frames and puts serial outputs to the bridge, and vice-versa

# Switched Networks

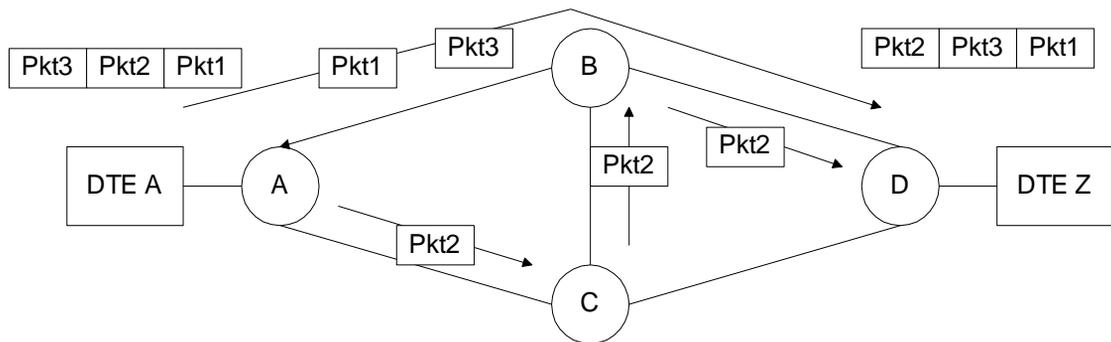

Figure 2.26(a) Datagram Configuration

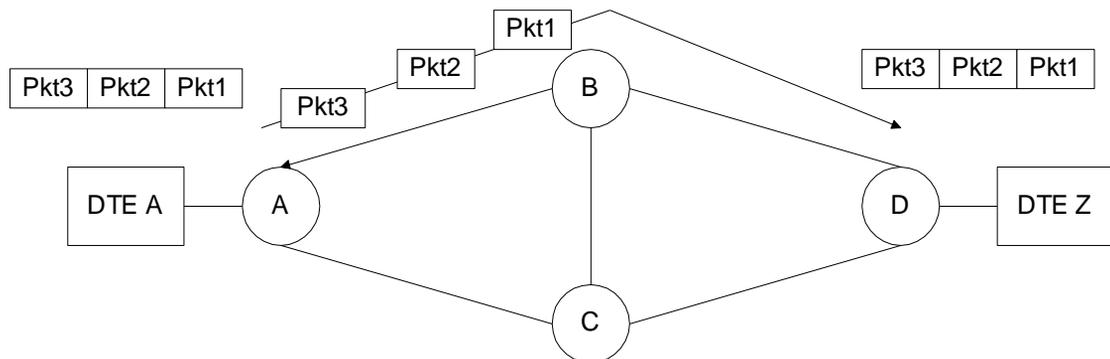

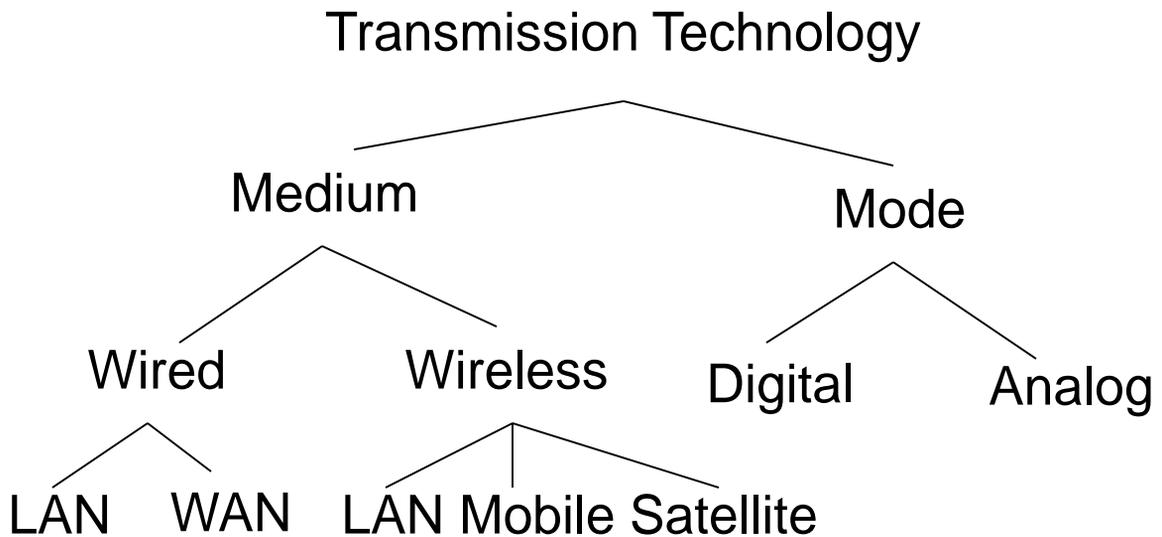

Figure 2.26(b) Virtual Circuit Configuration

## Notes

- Switches are embedded in bridges and routers
- Switched network used in WAN
- Two types of switched networks
  - Circuit-switched
  - Packet-switched
    - Datagram service
    - Virtual circuit

---

# Transmission Technology

---

## Notes

- Physical transport media
  - UTP
  - Coax
  - Fiber
- Terrestrial wireless
- Satellite transmission

# Transmission Modes

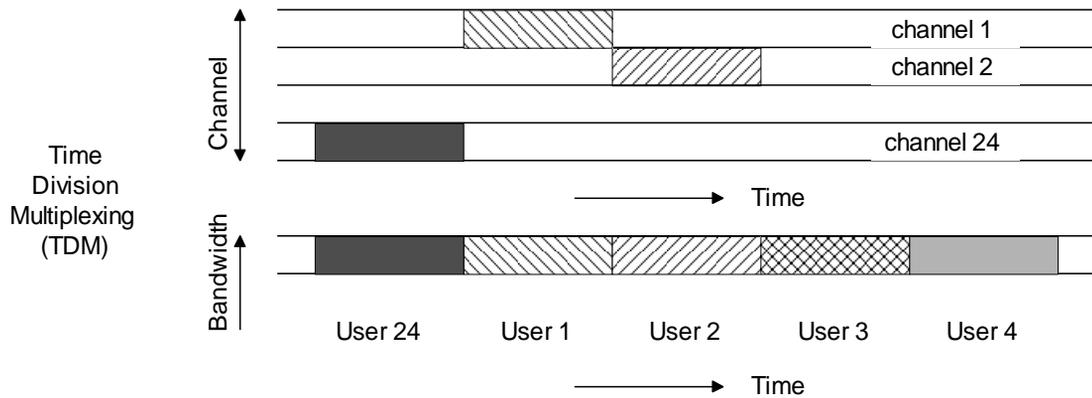

Figure 2.27(a) T1 Time Division Multiplexing (TDM) Transmission

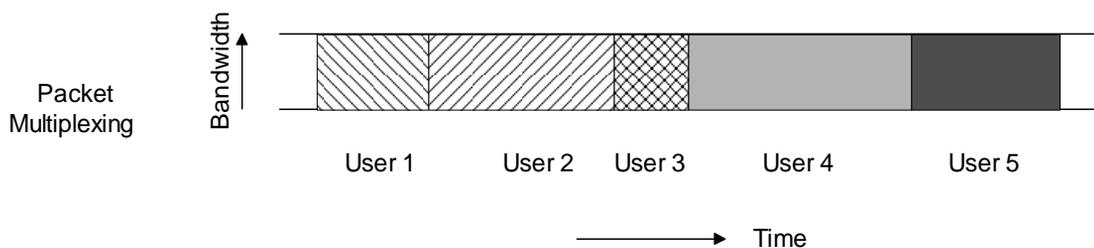

Figure 2.27(b) Packet Transmission ( X.25)

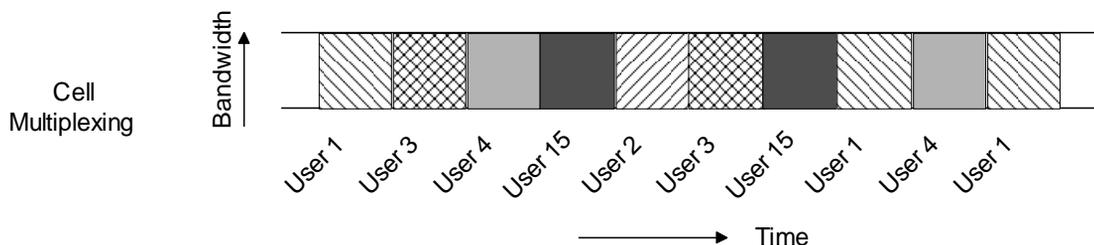

Figure 2.27(c) Cell Transmission (ATM)

## Notes

# Broadband Services

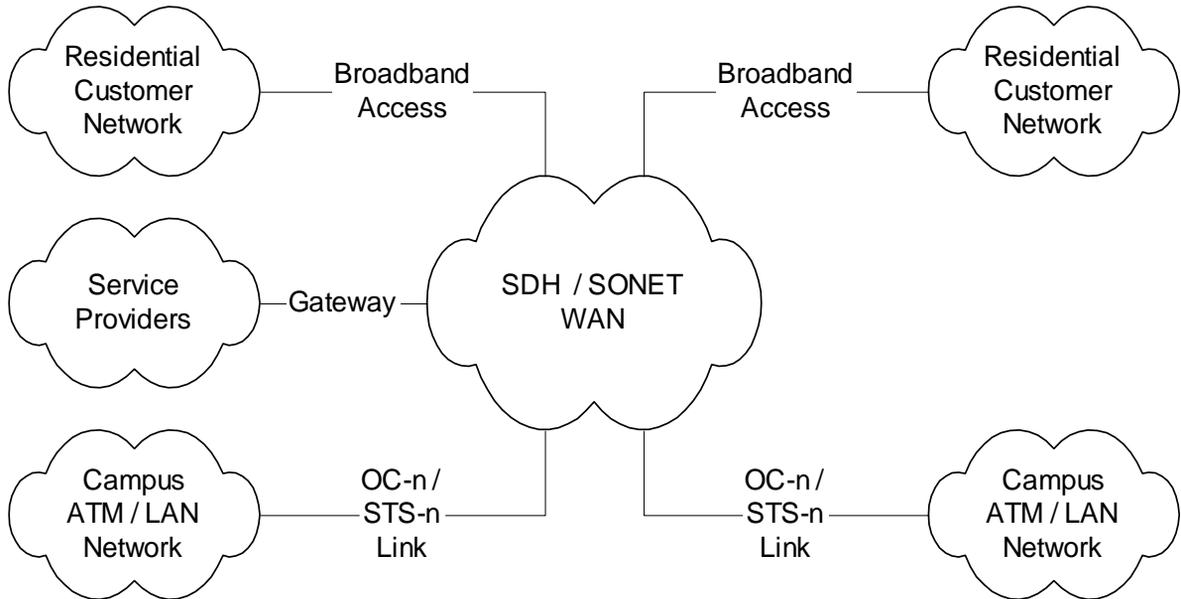

Figure 2.28 Broadband Services Network

## Notes

- Integrated services: Voice, video, and data
- Narrow band ISDN (Integrated Services Digital Net.)
  - Basic rate: 2B + D (B channel 64 kbps and D channel 16 kbps)
  - Primary rate: 23B + D channels
- Broadband (ISDN) Services uses ATM technology
  - SONET (Synchronous Optical Network) or SDH (Synchronous Digital Hierarchy)
  - Data rate OC-n
    - OC-1 51.84 Mbps
    - OC-3 155.52 Mbps
  - Access technologies:
    - HFC (Hybrid Fiber Coaxial) / Cable modem
    - ADSL (Asymmetric Digital Subscriber Line)

# Chapter 3

## Basic Foundations: Standards, Models, and Language

# Introduction

- Standards
  - Standards organizations
  - Protocol standards of transport layers
  - Protocol standards of management (application) layer
- Management Models
- Language

---

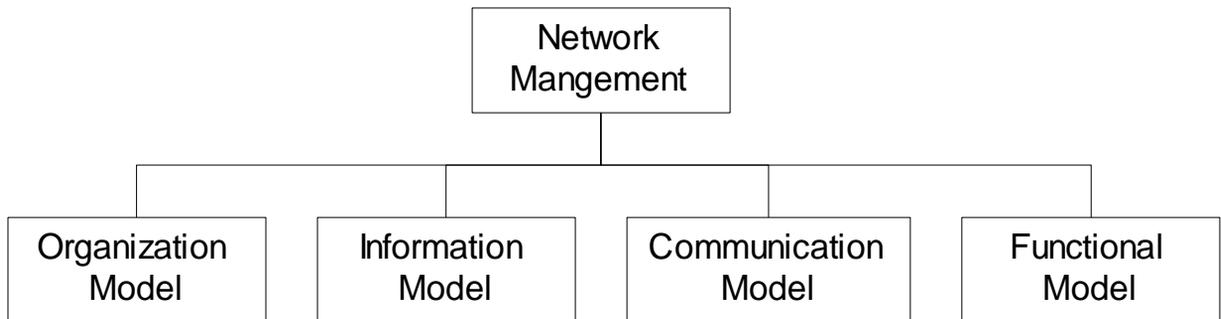

## Notes

**Table 3.1 Network Management Standards**

| Standard             | Salient Points   |
|----------------------|--|
| OSI / CMIP           | <ul style="list-style-type: none"> <li>■ International standard (ISO / OSI)</li> <li>■ Management of data communications network - LAN and WAN</li> <li>■ Deals with all 7 layers</li> <li>■ Most complete</li> <li>■ Object oriented</li> <li>■ Well structured and layered</li> <li>■ Consumes large resource in implementation</li> </ul> |
| SNMP / Internet      | <ul style="list-style-type: none"> <li>■ Industry standard (IETF)</li> <li>■ Originally intended for management of Internet components, currently adopted for WAN and telecommunication systems</li> <li>■ Easy to implement</li> <li>■ Most widely implemented</li> </ul>   |
| TMN                  | <ul style="list-style-type: none"> <li>■ International standard (ITU-T)</li> <li>■ Management of telecommunications network</li> <li>■ Based on OSI network management framework</li> <li>■ Addresses both network and administrative aspects of management</li> </ul>   |
| IEEE                 | <ul style="list-style-type: none"> <li>■ IEEE standards adopted internationally</li> <li>■ Addresses LAN and MAN management</li> <li>■ Adopts OSI standards significantly</li> <li>■ Deals with first two layers of OSI RM</li> </ul>  |
| Web-based Management | <ul style="list-style-type: none"> <li>■ Web-Based Enterprise Management (WBEM)</li> <li>■ Java Management Application Program Interface (JMAPI)</li> </ul>  |

---

# OSI Architecture and Model

**Figure 3.1 OSI Network Management Model**

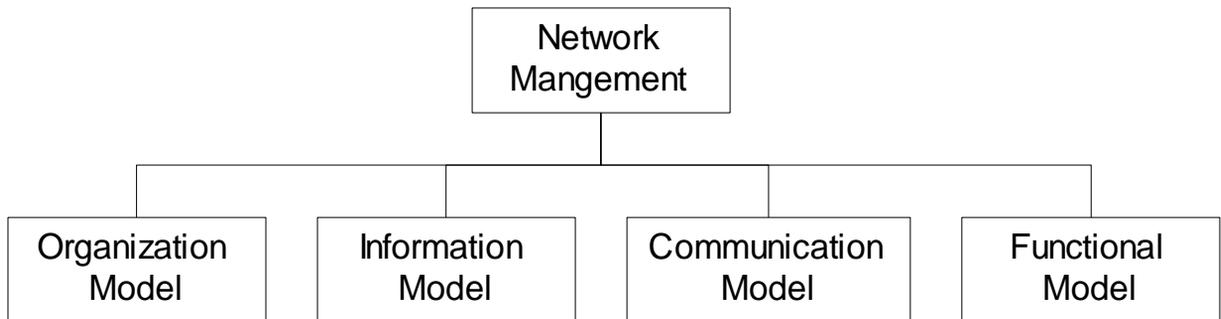

---

## Notes

- Organization
  - Network management components
  - Functions of components
  - Relationships
- Information
  - Structure of management information (SMI)
    - Syntax and semantics
  - Management information base (MIB)
    - Organization of management information
  - Object-oriented

---

# OSI Architecture and Model

**Figure 3.1 OSI Network Management Model**

---

## Notes

- Communication
  - Transfer syntax with bi-directional messages
  - Transfer structure (PDU)
- Functions
  - Application functions
    - Configure components
    - Monitor components
    - Measure performance
    - Secure information
    - Usage accounting

# SNMP Architecture and Model

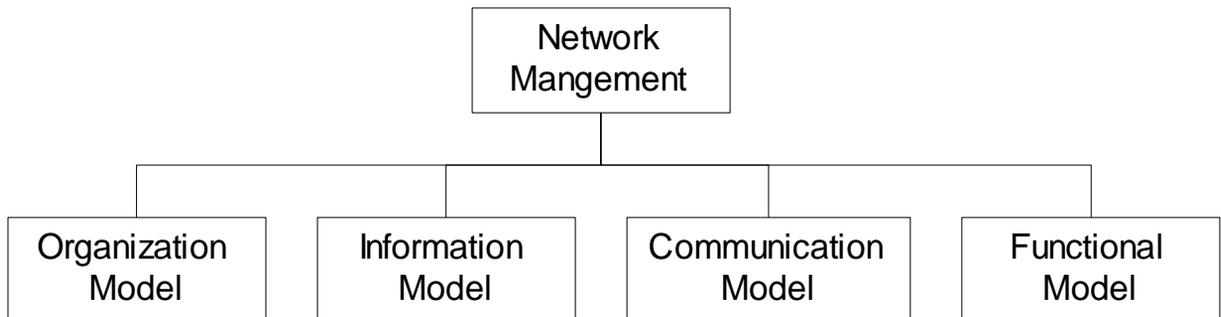

Figure 3.1 OSI Network Management Model

## Notes

- Organization
  - Same as OSI model
- Information
  - Same as OSI, but scalar
- Communication
  - Messages less complex than OSI and unidirectional
  - Transfer structure (PDU)
- Functions
  - Application functions
    - Operations
    - Administration
    - Security

# TMN Architecture

- Addresses management of telecommunication networks
- Based on OSI model
- Superstructure on OSI network
- Addresses network, service, and business management

---

## Notes

# Organizational Model

- Manager
  - Sends requests to agents
  - Monitors alarms
  - Houses applications
  - Provides user interface
- Agent
  - Gathers information from objects
  - Configures parameters of objects
  - Responds to managers' requests
  - Generates alarms and sends them to managers
- Managed object
  - Network element that is managed
  - Houses management agent
  - All objects are not managed / manageable

---

## Notes

# Two-Tier Model

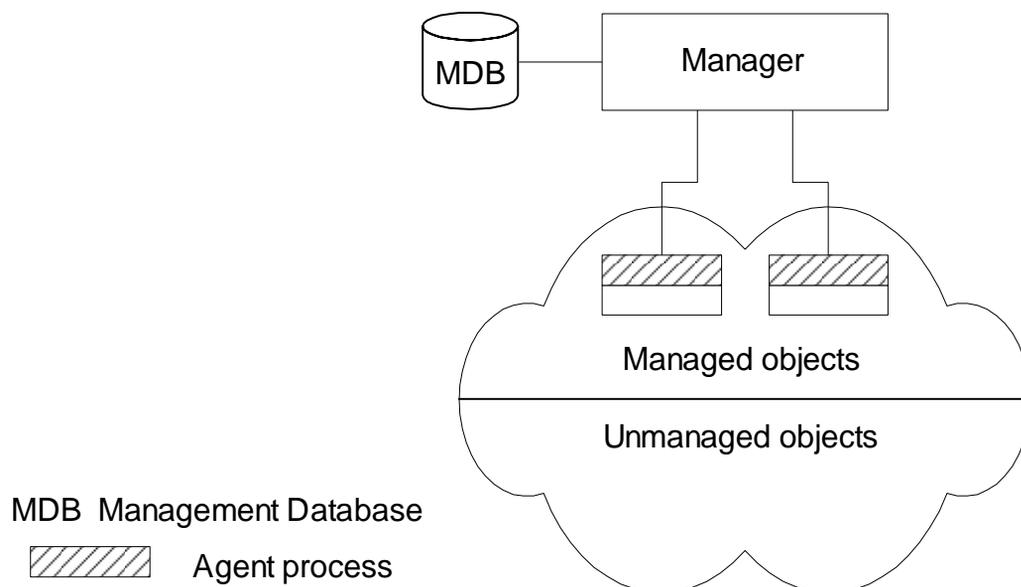

Figure 3.2 Two-Tier Network Management Organization Model

## Notes

- Agent built into network element  
Example: Managed hub, managed router
- An agent can manage multiple elements  
Example: Switched hub, ATM switch
- MDB is a physical database
- Unmanaged objects are network elements that are not managed - both physical (unmanaged hub) and logical (passive elements)

# Three-Tier Model

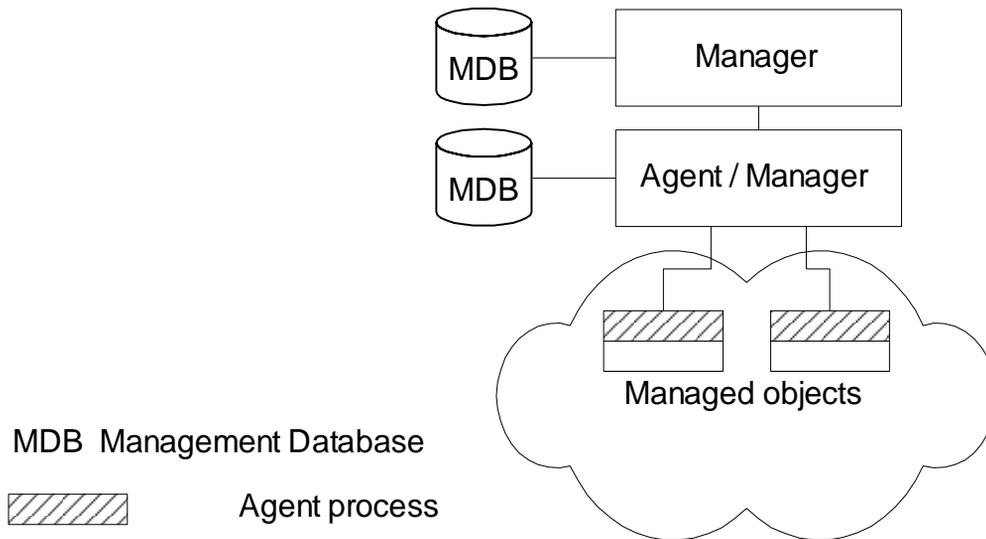

Figure 3.3 Three-Tier Network Management Organization Model

## Notes

- Middle layer plays the dual role
  - Agent to the top-level manager
  - Manager to the managed objects
- Example of middle level: Remote monitoring agent (RMON)

# Manager of Managers

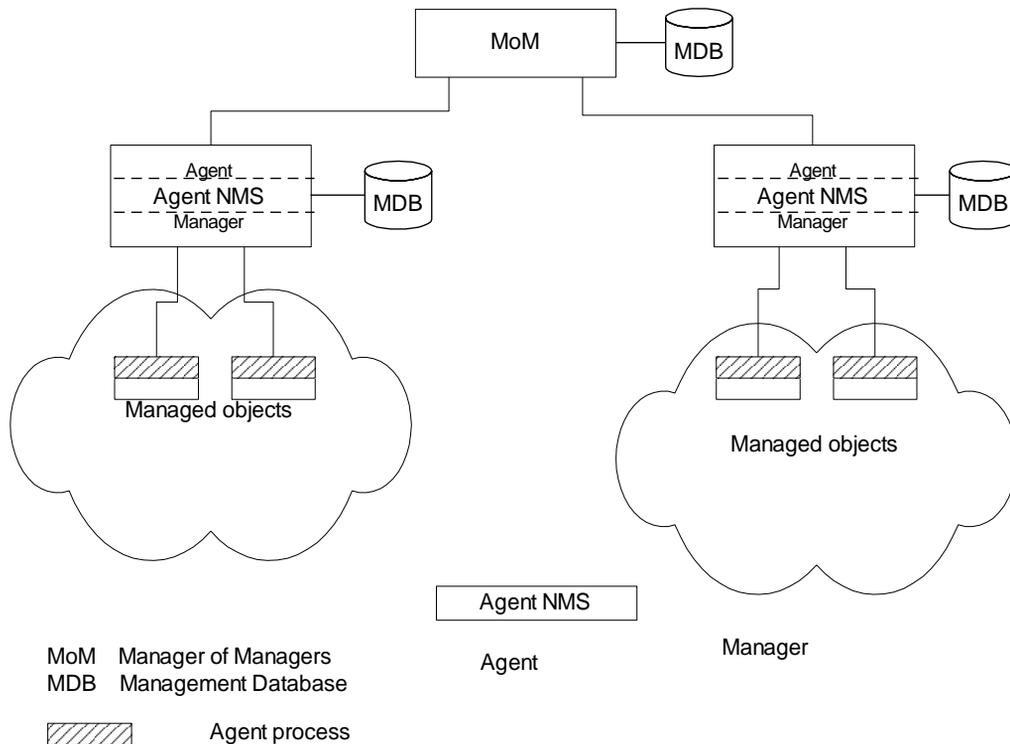

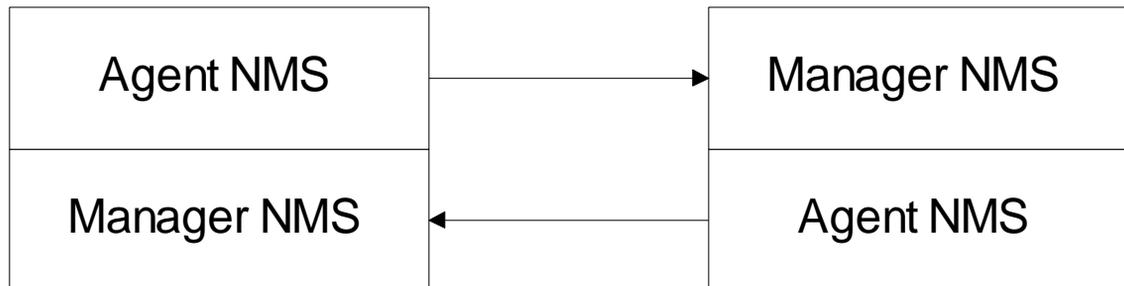

Figure 3.4 Network Management Organization Model with MoM

## Notes

- Agent NMS manages the domain
- MoM presents integrated view of domains
- Domain may be geographical, administrative, vendor-specific products, etc.

---

# Peer NMSs

**Figure 3.5 Dual Role of Management Process**

---

## Notes

- Dual role of both NMSs
- Network management system acts as peers
- Dumbbell architecture discussed in Chapter 1
- Notice that the manager and agent functions are processes and not systems

# Information Model: Analogy

- Figure in a book uniquely identified by
  - ISBN, Chapter, and Figure number in that hierarchical order
- ID: {ISBN, chapter, figure}
- The three elements above define the syntax
- Semantics is the meaning of the three entities according to Webster's dictionary
- The information comprises syntax and semantics about an object

---

## Notes

# Structure of Management Information (SMI)

- SMI defines for a managed object
  - Syntax
  - Semantics
  - plus additional information such as status
- Example

sysDescr: { system 1 }

Syntax: OCTET STRING

Definition: "A textual description of the entity. "

Access: read-only

Status: mandatory

---

## Notes

# Management Information Base (MIB)

- Information base contains information about objects
- Organized by grouping of related objects
- Defines relationship between objects
- It is NOT a physical database. It is a *virtual* database that is compiled into management module

---

## Notes

# Information Base View: An Analogy

- Fulton County library system has many branches
- Each branch has a set of books
- The books in each branch is a different set
- The information base of the county has the view (catalog) of all books
- The information base of each branch has the catalog of books that belong to that branch. That is, each branch has its view (catalog) of the information base
- Let us apply this to MIB view

---

## Notes

# MIB View and Access of an Object

- A managed object has many attributes - its information base
- There are several operations that can be performed on the objects
- A user (manager) can view and perform only certain operations on the object by invoking the management agent
- The view of the object attributes that the agent perceives is the MIB view
- The operation that a user can perform is the MIB access

---

## Notes

# Management Data Base / Information Base

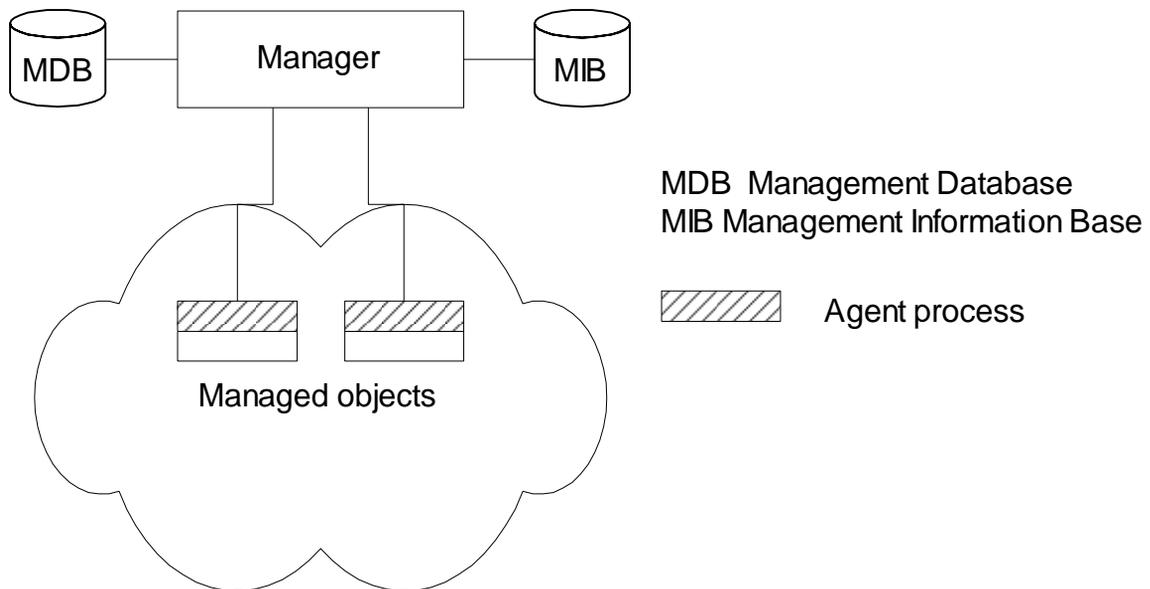

Figure 3.6 Network Configuration with Data and Information Base

## Notes

- Distinction between MDB and MIB
  - MDB physical database; e.g.. Oracle, Sybase
  - MIB virtual database; schema compiled into management software
- An NMS can automatically discover a managed object, such as a hub, when added to the network
- The NMS can identify the new object as hub only after the MIB schema of the hub is compiled into NMS software

# Managed Object

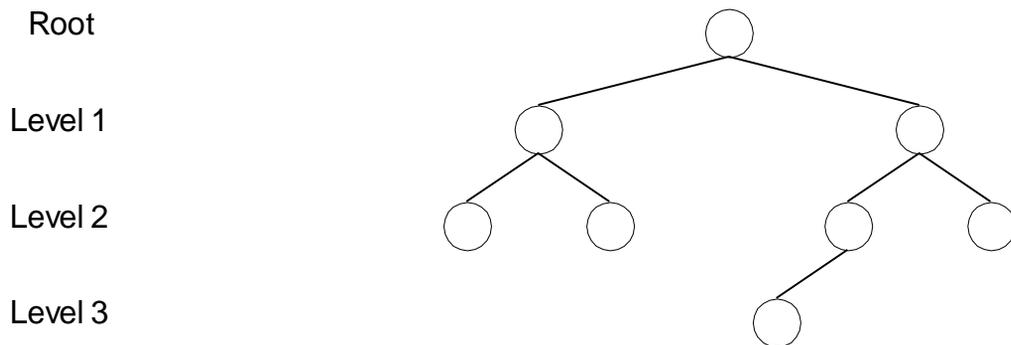

- Managed objects can be
  - Network elements (hardware, system)
    - hubs, bridges, routers, transmission facilities
  - Software (non-physical)
    - programs, algorithms
  - Administrative information
    - contact person, name of group of objects (IP group)

---

## Notes

---

# Management Information Tree

**Figure 3.7 Generic Representation of Management Information Tree**

---

## Notes

# OSI Management Information Tree

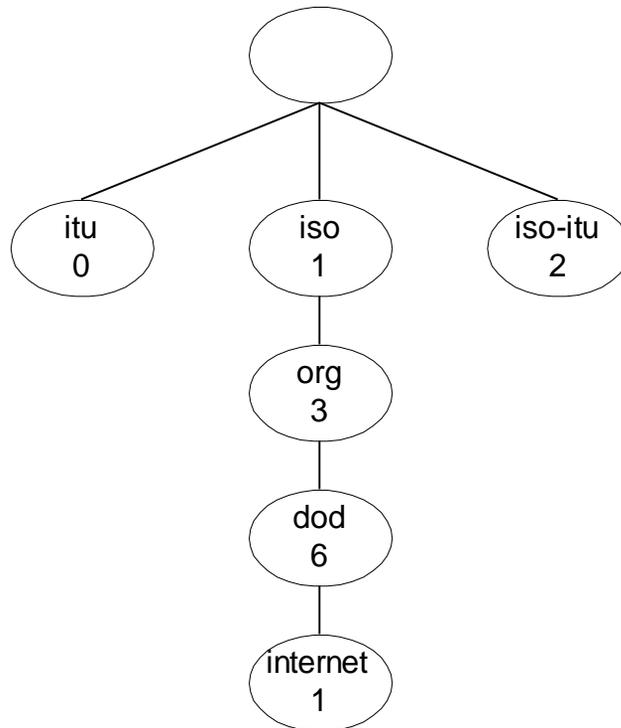

Figure 3.8 OSI Management Information Tree

## Notes

- iso International Standards Organization
- itu International Telecommunications Union
- dod Department of Defense
- Designation:
  - iso 1
  - org 1.3
  - dod 1.3.6
  - internet 1.3.6.1

# Object Type and Instance

- Type
  - Name
  - Syntax
  - Definition
  - Status
  - Access
- Instance

---

## Notes

- Example of a circle
  - “circle” is syntax
  - Semantics is definition from dictionary”  
“A plane figure bounded by a single curved line, every point of which is of equal distance from the center of the figure.”
- Analogy of nursery school

# Managed Object: Internet Perspective

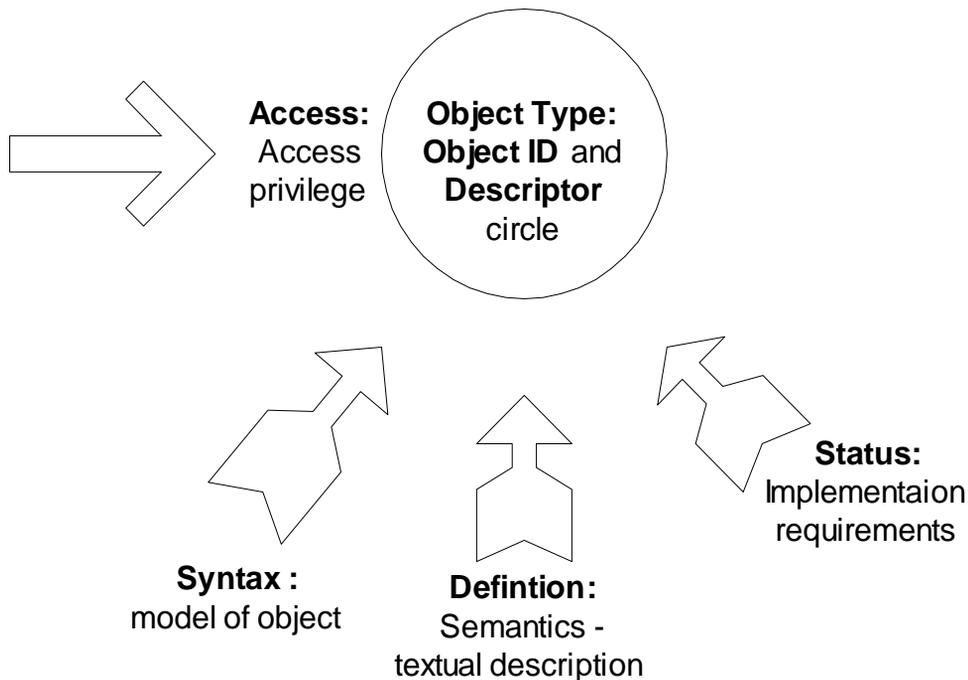

Figure 3.9(a) Internet Perspective

## Notes

- *object ID* unique ID
- *and descriptor* and name for the object
- *syntax* used to model the object
- *access* access privilege to a managed object
- *status* implementation requirements
- *definition* textual description of the semantics of object type

# Managed Object: OSI Perspective

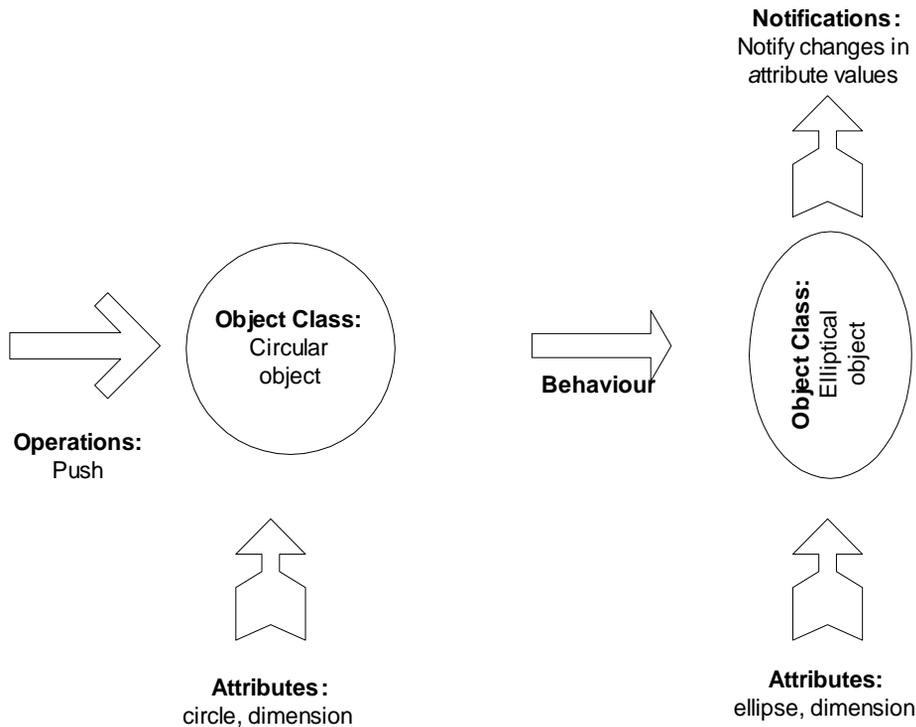

Figure 3.9(b) OSI Perspective

## Notes

- *object class* managed object
- *attributes* attributes visible at its boundary
- *operations* operations which may be applied to it
- *behaviour* behaviour exhibited by it in response to operation
- *notifications* notifications emitted by the object

# Packet Counter Example

| Characteristics    | Example                  |
|--------------------|--------------------------|
| <i>Object type</i> | PktCounter               |
| <i>Syntax</i>      | Counter                  |
| <i>Access</i>      | Read-only                |
| <i>Status</i>      | Mandatory                |
| <i>Description</i> | Counts number of packets |

**Figure 3.10(a) Internet Perspective**

| Characteristics      | Example                              |
|----------------------|--------------------------------------|
| <i>Object class</i>  | Packet Counter                       |
| <i>Attributes</i>    | Single-valued                        |
| <i>Operations</i>    | get, set                             |
| <i>Behavior</i>      | Retrieves or resets values           |
| <i>Notifications</i> | Generates notifications on new value |

**Figure 3.10 (b) OSI Perspective**

**Figure 3.10 Packet Counter As Example of Managed Object**

---

## Notes

# Internet Vs OSI Managed Object

- Scalar object in Internet Vs Object-oriented approach in OSI
- OSI characteristics of operations, behaviour, and notification are part of communication model in Internet: get/set and response/alarm
- Internet syntax is absorbed as part of OSI attributes
- Internet access is part of OSI security model
- Internet status is part of OSI conformance application
- OSI permits creation and deletion of objects; Internet does not: Enhancement in SNMPv2

---

## Notes

# Mgmt. Communication Model

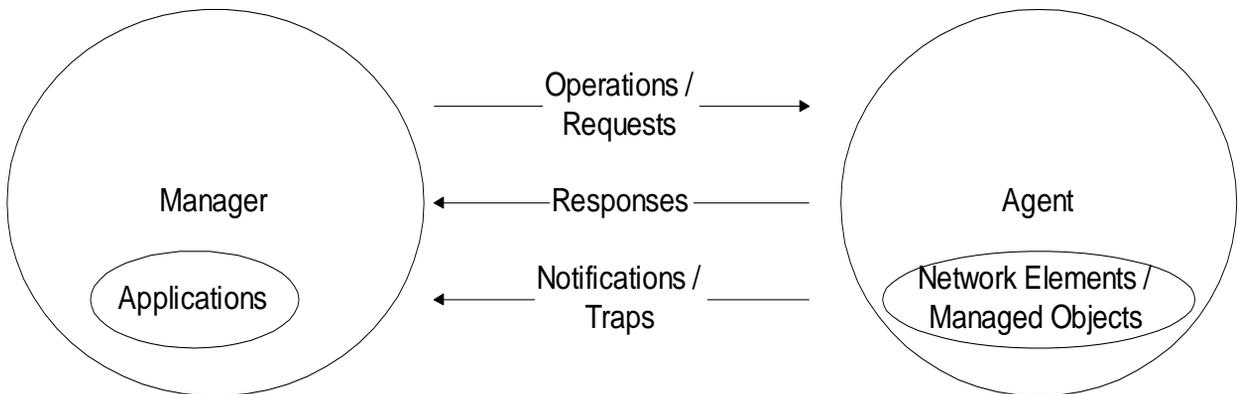

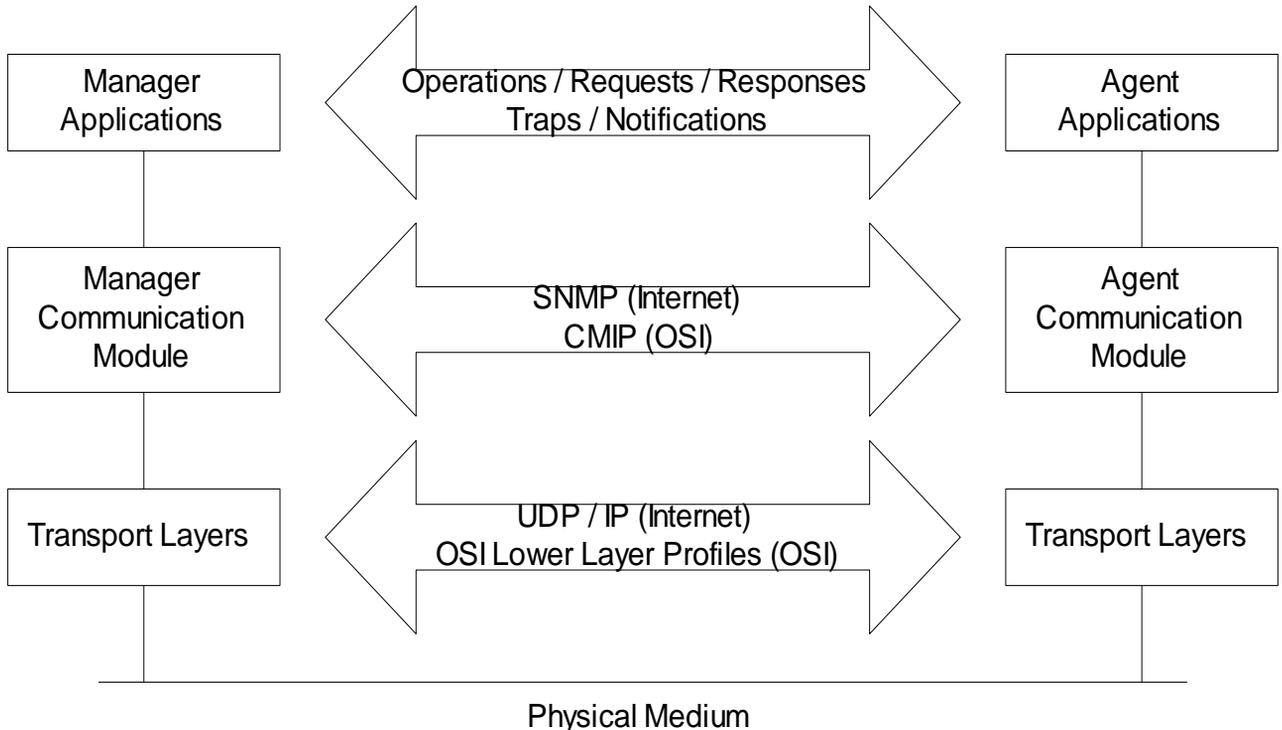

Figure 3.11 Management Message Communication Model

## Notes

- In Internet requests/responses, in OSI operations
- In Internet traps and notifications (SNMPv2), in OSI notifications

# Transfer Protocols

**Figure 3.12 Management Communication Transfer Protocols**

## Notes

- Internet is based on SNMP; OSI is based on CMIP
- OSI uses CMISE (Common Management Information Service Element) application with CMIP
- OSI specifies both c-o and connectionless transport protocol; SNMPv2 extended to c-o, but rarely used

# Abstract Syntax Notation One

- ASN.1 is more than a syntax; it's a language
  - Addresses both syntax and semantics
  - Two type of syntax
    - Abstract syntax: set of rules that specify data type and structure for information storage
    - Transfer syntax: set of rules for communicating information between systems
  - Makes application layer protocols independent of lower layer protocols
  - Can generate machine-readable code: Basic Encoding Rules (BER) is used in management modules
- 

## Notes

---

# Backus-Naur Form (BNF)

## Definition:

$\langle \text{name} \rangle ::= \langle \text{definition} \rangle$

## Rules:

$\langle \text{digit} \rangle ::= 0|1|2|3|4|5|6|7|8|9$

$\langle \text{number} \rangle ::= \langle \text{number} \rangle | \langle \text{digit} \rangle \langle \text{number} \rangle$

$\langle \text{op} \rangle ::= +|-|*|/$

$\langle \text{SAE} \rangle ::= \langle \text{number} \rangle | \langle \text{SAE} \rangle | \langle \text{SAE} \rangle \langle \text{op} \rangle \langle \text{SAE} \rangle$

## Example:

- 9 is *primitive* 9
- 19 is *construct* of 1 and 9
- 619 is *construct* of 6 and 19

---

## Notes

- BNF is used for ASN.1 constructs
- Constructs developed from primitives
- The above example illustrates how numbers are constructed from the primitive  $\langle \text{digit} \rangle$
- Simple Arithmetic Expression entity ( $\langle \text{SAE} \rangle$ ) is constructed from the primitives  $\langle \text{digit} \rangle$  and  $\langle \text{op} \rangle$

# Simple Arithmetic Expression

$\langle \text{SAE} \rangle ::= \langle \text{number} \rangle \mid \langle \text{SAE} \rangle \langle \text{op} \rangle \langle \text{number} \rangle$

Example:  $26 = 13 \times 2$

Constructs and primitives

---

## Notes

---

# Type and Value

- Assignments
  - `<BooleanType> ::= BOOLEAN`
  - `<BooleanValue> ::= TRUE | FALSE`
- ASN.1 module is a group of assignments  
person-name    Person-Name ::=  
    {  
    first        "John",  
    middle     "I",  
    last        "Smith"  
    }

---

## Notes

# Data Type: Example 1

```

PersonnelRecord ::= SET
{
    Name,
    title    GraphicString,
    division CHOICE
        marketing    [0] SEQUENCE
            {Sector,
             Country},
        research    [1] CHOICE
            {product-based [0] NULL,
             basic        [1] NULL},
        production  [2] SEQUENCE
            {Product-line,
             Country }
}

```

etc.

**Figure 3.13 ASN.1 Data Type Definition Example 1**

## Notes

- Module name starts with capital letters
- Data types:
  - Primitives: NULL, GraphicString
  - Constructs
    - Alternatives : CHOICE
    - List maker: SET, SEQUENCE
    - Repetition: SET OF, SEQUENCE OF:
- Difference between SET and SEQUENCE

---

## Data Type: Example 2

```
Trade-message ::= SEQUENCE
  {invoice-no      INTEGER
   name           GraphicString,
   details        SEQUENCE OF
                  SEQUENCE
                  {part-no      INTEGER
                   quantity     INTEGER},
   charge         REAL,
   authenticator  Security-Type}
```

```
Security-Type ::= SET
  {
    ...
    ...
    ... }
```

**Figure 3.14 ASN.1 Data Type Definition Example 2**

---

### Notes

- SEQUENCE OF SEQUENCE makes tables of rows

---

# ASN.1 Symbols

| Symbol | Meaning                            |
|--------|------------------------------------|
| ::=    | Defined as                         |
|        | or, alternative, options of a list |
| -      | Signed number                      |
| --     | Following the symbol are comments  |
| {}     | Start and end of a list            |
| []     | Start and end of a tag             |
| ()     | Start and end of subtype           |
| ..     | Range                              |

---

## Notes

# Keyword Examples

- CHOICE
- SET
- SEQUENCE
- OF
- NULL

---

## Notes

- Keywords are in all UPPERCASE letters

---

# ASN.1 Data Type Conventions

| Data Types            | Convention               | Example                  |
|-----------------------|--------------------------|--------------------------|
| Object name           | Initial lowercase letter | sysDescr, etherStatsPkts |
| Application data type | Initial uppercase letter | Counter, IpAddress       |
| Module                | Initial uppercase letter | PersonnelRecord          |
| Macro, MIB module     | All uppercase letters    | RMON-MIB                 |
| Keywords              | All uppercase letters    | INTEGER, BEGIN           |

---

## Notes

# Data Type: Structure & Tag

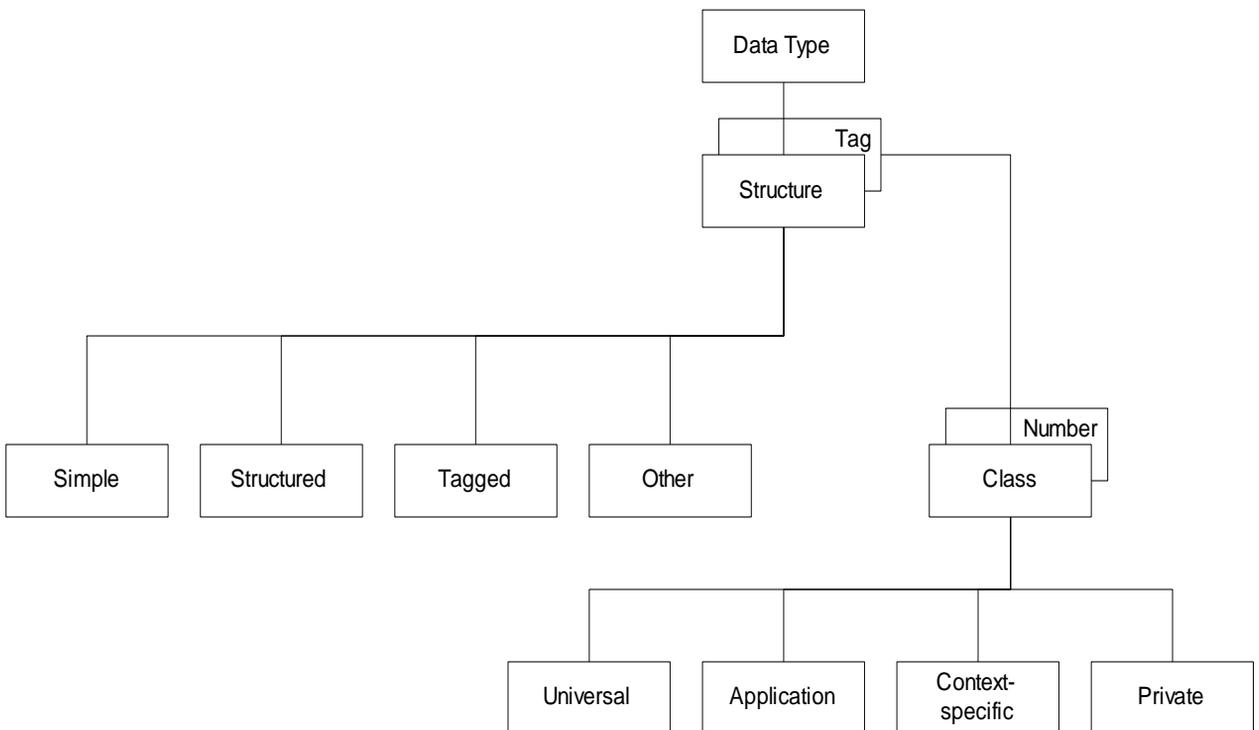

Figure 3.15 ASN.1 Data Type Structure and Tag

## Notes

- Structure defines how data type is built
- Tag uniquely identifies the data type

# Tag

- Tag uniquely identifies a data type
- Comprises *class* and *tag number*
- Class:
  - Universal - always true
  - Application - only in the application used
  - Context-specific - specific context in application
  - Private - used extensively by commercial vendors

---

## Notes

Example:

BOOLEAN      Universal 1

INTEGER      Universal 2

research      Application [1] (Figure 3.13)

product-based Context-specific under *research* [0]

---

# Enumerated Integer

```
RainbowColors ::= ENUMERATED
{
    violet      (0)
    indigo      (1)
    blue        (2)
    green       (3)
    yellow      (4)
    orange      (5)
    red         (6)
}
```

---

## Notes

- ENUMERATED is a special case of INTEGER
- Example: RainbowColors(5) is orange

---

# ASN.1 Module Example

```
IpNetMediaEntry ::=SEQUENCE{  
    ipNetToMediaIfIndex      INTEGER  
    ipNetToMediaPhysAddress  PhysAddress  
    ipNetToMediaNetAddress   IpAddress  
    ipNetToMediaType         INTEGER}
```

---

## Notes

Name: John P Smith  
 Title: Director  
 Employee Number 51  
 Date of Hire: 17 September 1971  
 Name of Spouse; Mary T Smith  
 Number of Children 2

Child Information

Name Ralph T Smith  
 Date of Birth 11 November 1957

Child Information

Name Susan B Jones  
 Date of Birth 17 July 1959

(a) Informal description of personnel record

```
PersonnelRecord ::= [APPLICATION 0] IMPLICIT SET {
  Name,
  title [0] VisibleString,
  number EmployeeNumber,
  dateOfHire [1] Date,
  nameOfSpouse [2] Name,
  children [3] IMPLICIT SEQUENCE OF ChildInformation DEFAULT { } }
```

```
ChildInformation ::= SET {
  Name,
  dateOfBirth [0] Date }
```

```
Name ::= [APPLICATION 1] IMPLICIT SEQUENCE {
  givenName VisibleString,
  initial VisibleString,
  familyName VisibleString }
```

```
EmployeeNumber ::= [APPLICATION 2] IMPLICIT INTEGER
```

```
Date ::= [APPLICATION 3] IMPLICIT VisibleString -- YYYYMMDD
```

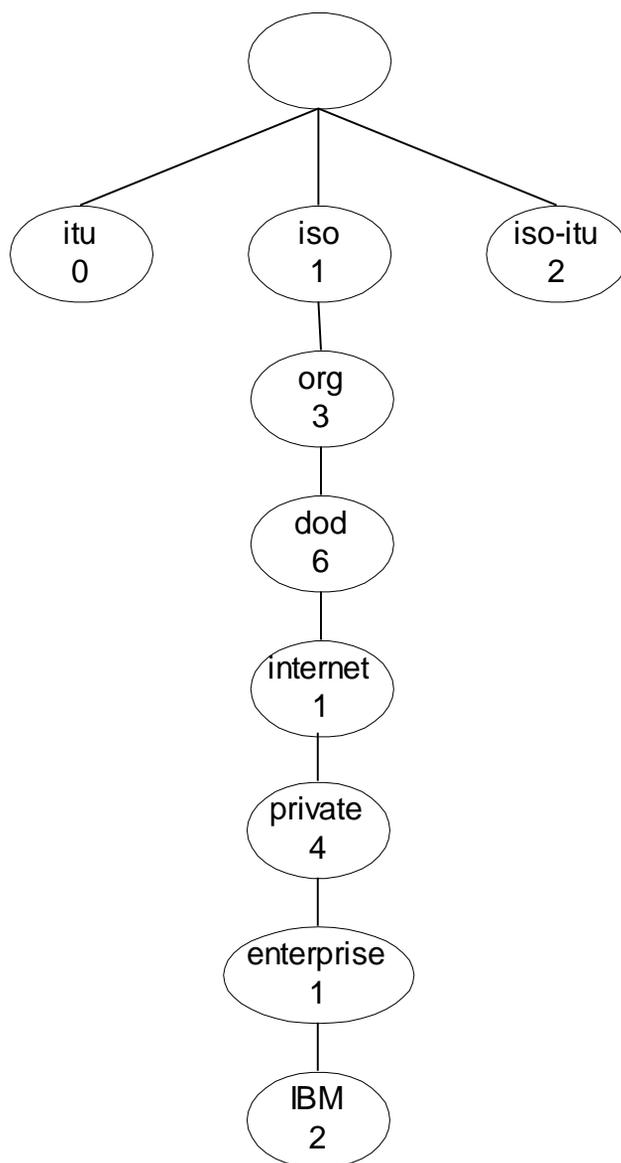

(b) ASN.1 description of the record structure

```
{
  title {givenName "John", initial "T", familyName "Smith"},
  number "51",
  dateOfHire "19710917",
  nameOfSpouse {givenName "Mary", initial "T", familyName "Smith"},
  children {
    {
      dateOfBirth {givenName "Ralph", initial "T", familyName "Smith"},
        "19571111"},
    {
      dateOfBirth {givenName "Susan", initial "B", familyName "Jones"},
        "19590717"}}}
```

(c) ASN.1 description of a record value

---

# Object Name

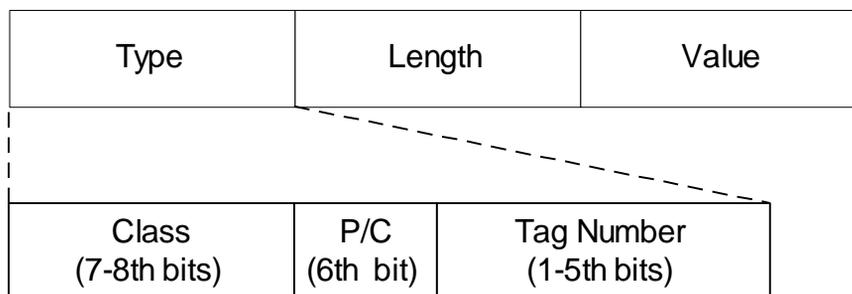

---

## Notes

- internet OBJECT IDENTIFIER ::= {ISO(1) ORG(3) DOD(6) INTERNET(1)}

# TLV Encoding

| Class            | 8 <sup>th</sup> bit | 7 <sup>th</sup> bit |
|------------------|---------------------|---------------------|
| Universal        | 0                   | 0                   |
| Application      | 0                   | 1                   |
| Context-specific | 1                   | 0                   |
| Private          | 1                   | 1                   |

## Notes

- TLV Type, length, and value are components of the structure

# Macro

```
<macroname> MACRO ::=
BEGIN
    TYPE NOTATION ::= <syntaxOfNewType>
    VALUE NOTATION ::= <syntaxOfNewValue>
    <auxiliaryAssignments>
END
```

Example:

```
CS8803 OBJECT-IDENTITY
STATUS      current
DESCRIPTION "A graduate-level network
management course offered every fall by
College of Computing in Georgia Institute of
Technology."
           ::= {csclasses 50}
```

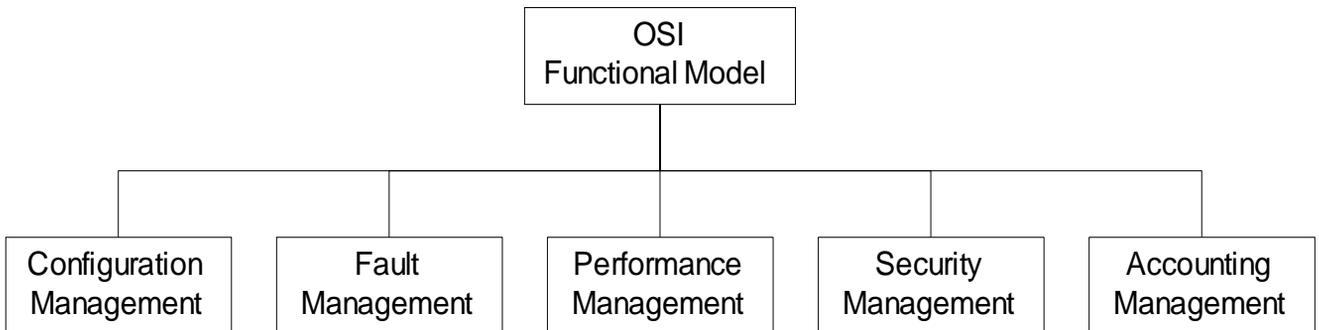

---

## Notes

- Macro is used to create new data types

---

# Functional Model

---

## Notes

- Configuration management
  - set and change network configuration and component parameters
  - Set up alarm thresholds
- Fault management
  - Detection and isolation of failures in network
  - Trouble ticket administration
- Performance management
  - Monitor performance of network
- Security management
  - Authentication
  - Authorization
  - Encryption
- Accounting management
  - Functional accounting of network usage

# Chapter 4

## SNMPv1:

### Organization and Information Models

# Case Histories

- AT&T Network Management Centers
  - Network Control Centers
  - Network Operations Center
- CNN World Headquarters
- Centralized troubleshooting of NIC
- Performance degradation due to NMS
- Bell Operating company procedure

---

## Notes

# Managed LAN

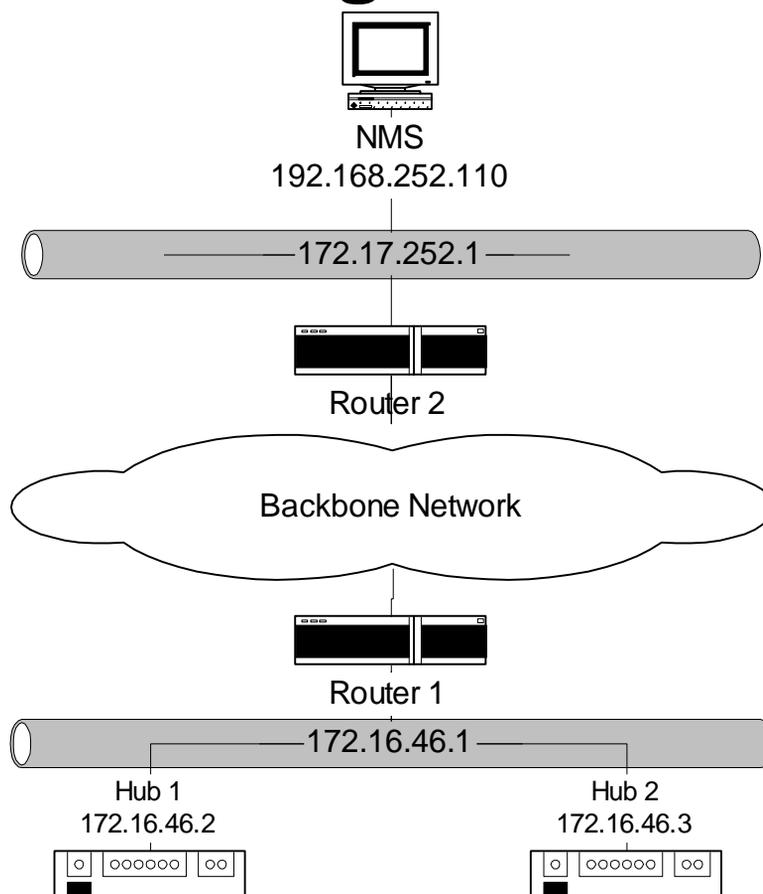

Figure 4.1 A Managed LAN Network

## Notes

- NMS on subnet 192.168.252.1 manages the router and the hubs on subnet 172.16.46.1 across the backbone network

---

# Managed Hub: System Information

Title: System Information: 172.16.46.2

Name or IP Address: 172.16.46.2

System Name :

System Description : 3Com LinkBuilder FMS, SW  
version:3.02

System Contact :

System Location :

System Object ID :

.iso.org.dod.internet.private.enterprises.43.1.8.5

System Up Time : (2475380437) 286 days, 12:03:24.37

Figure 4.2(a) System Information on 172.16.46.2 Hub

---

## Notes

- Information obtained querying the hub
- Data truly reflects what is stored in the hub

# Managed Router: System Information

Title: System Information: router1.gatech.edu

Name or IP Address: 172.16.252.1

System Name : router1.gatech.edu

System Description : Cisco Internetwork Operating System Software  
: IOS (tm) 7000 Software (C7000-JS-M), Version

## Notes

---

# Managed Hub: Port Addresses

| Index | Interface | IP address    | Network Mask  | Network Address | Link Address   |
|-------|-----------|---------------|---------------|-----------------|----------------|
|       |           |               |               |                 |                |
| 1     | 3Com      | 172.16.46.2   | 255.255.255.0 | 172.16.46.0     | 0x08004E07C25C |
| 2     | 3Com      | 192.168.101.1 | 255.255.255.0 | 192.168.101.0   | <none>         |

---

## Notes

- Information acquired by the NMS on hub interfaces
- Index refers to the interface on the hub
- Link address is the MAC address
- The second row data is a serial link

# Managed Router: Port Addresses

| Index | Interface    | IP address         | Network Mask  | Network Address   | Link Address   |
|-------|--------------|--------------------|---------------|-------------------|----------------|
| 23    | LEC.1.0      | 192.168.3.1        | 255.255.255.0 | 192.168.3.0       | 0x00000C3920B4 |
| 25    | LEC.3.9      | 192.168.252.1<br>5 | 255.255.255.0 | 192.168.252.<br>0 | 0x00000C3920B4 |
| 13    | Ethernet2/0  | 172.16..46.1       | 255.255.255.0 | 172.16..46.0      | 0x00000C3920AC |
| 16    | Ethernet2/3  | 172.16.49.1        | 255.255.255.0 | 172.16.49.0       | 0x00000C3920AF |
| 17    | Ethernet2/4  | 172.16.52.1        | 255.255.255.0 | 172.16.52.0       | 0x00000C3920B0 |
| 9     | Ethernet1/2  | 172.16.55.1        | 255.255.255.0 | 172.16.55.0       | 0x00000C3920A6 |
| 2     | Ethernet 0/1 | 172.16.56.1        | 255.255.255.0 | 172.16.56.0       | 0x00000C39209D |
| 15    | Ethernet2/2  | 172.16.57.1        | 255.255.255.0 | 172.16.57.0       | 0x00000C3920AE |
| 8     | Ethernet1/1  | 172.16.58.1        | 255.255.255.0 | 172.16.58.0       | 0x00000C3920A5 |
| 14    | Ethernet2/1  | 172.16.60.1        | 255.255.255.0 | 172.16.60.0       | 0x00000C3920AD |

## Notes

- Information acquired by NMS on the router interfaces
- Index refers to the interface on the router
- LEC is the LAN emulation card
- Ethernet 2/0 interface refers to the interface card 2 and port 0 in that card

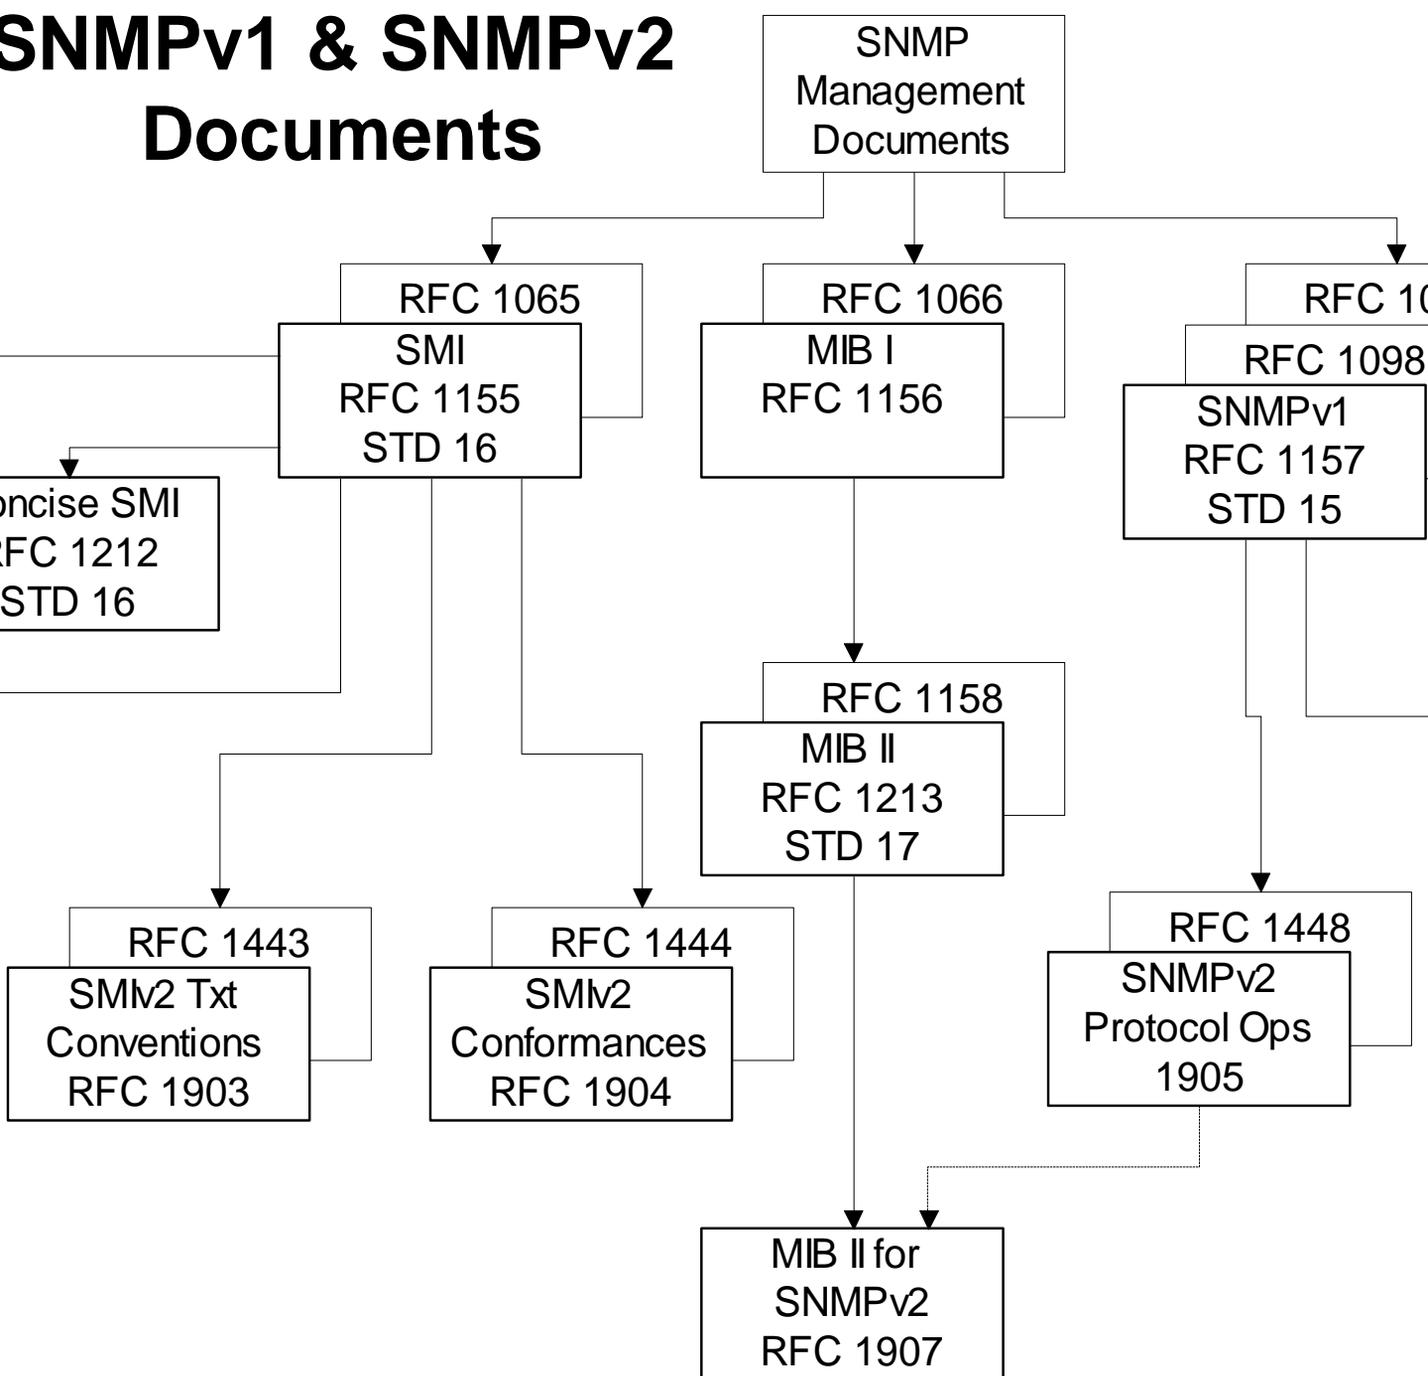

# Internet SNMP Management

- 1970      Advanced Research Project Agency Network (ARPANET)  
            Internet control Message Protocol (ICMP)
- Internet Engineering Task Force (IETF)
  - 1990              SNMPv1
  - 1995              SNMPv2
  - 1998              SNMPv3
- Internet documents:
  - Request for Comments (RFC)
  - IETF STD Internet Standard
  - FYI For your information
- Source for RFCs
  - <ftp://nic.mil/rfc>
  - <ftp://ftp.internic.net/rfc>
  - <http://nic/internet.net/>

---

## Notes

# SNMPv1 & SNMPv2 Documents

**Figure 4.4 SNMP Document Evolution**

# SNMP Model

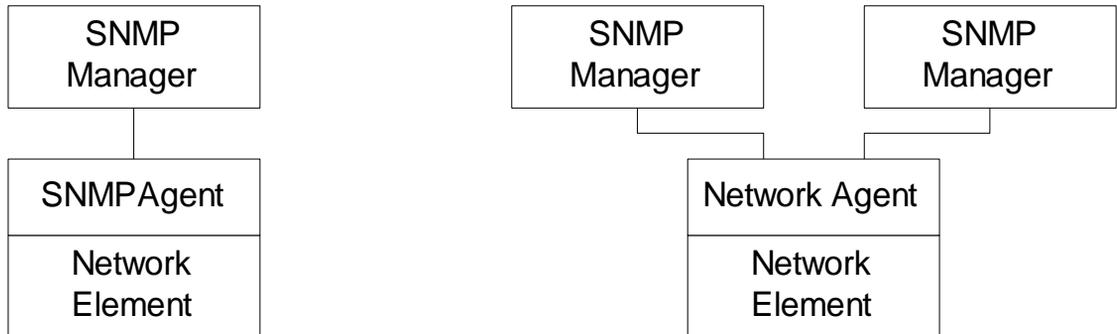

- Organization Model
  - Relationship between network element, agent, and manager
  - Hierarchical architecture
- Information Model
  - Uses ASN.1 syntax
  - SMI (Structure of Management Information)
  - MIB ( Management Information Base)
- Communication Model
  - Transfer syntax
  - SNMP over TCP/IP
  - Communication services addressed by messages
  - Security framework community-based model

---

## Notes

---

# Two-Tier Organization Model

(a) One Manager - One Agent Model

(b) Multiple Managers - One Agent Model

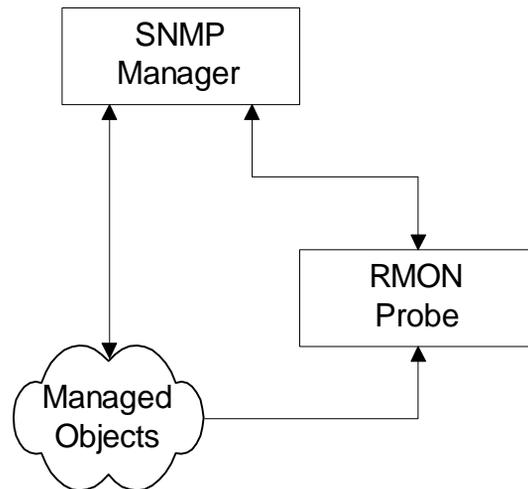

---

## Notes

- Any host that could query an agent is a manager

---

# Three-Tier Organization Model: RMON

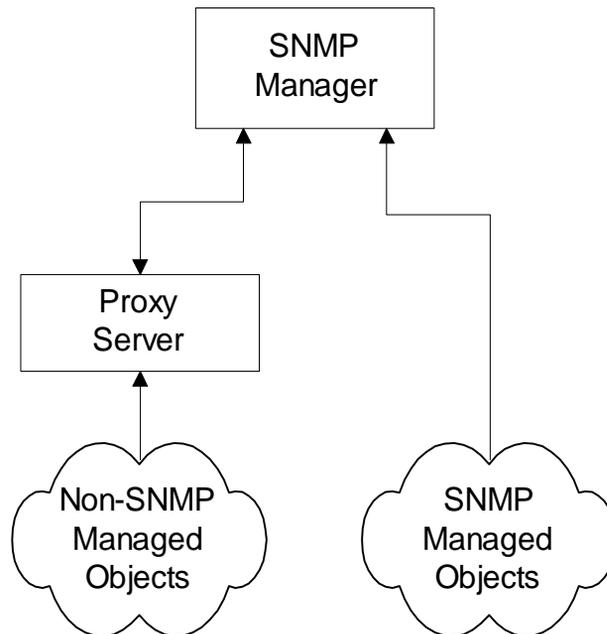

---

## Notes

- Managed object comprises network element and management agent
- RMON acts as an agent and a manager
- RMON (Remote Monitoring) gathers data from MO, analyses the data, and stores the data
- Communicates the statistics to the manager

---

# Three-Tier Organization Model: Proxy Server

---

## Notes

- Proxy server converts non-SNMP data from non-SNMP objects to SNMP compatible objects and messages

# System Architecture

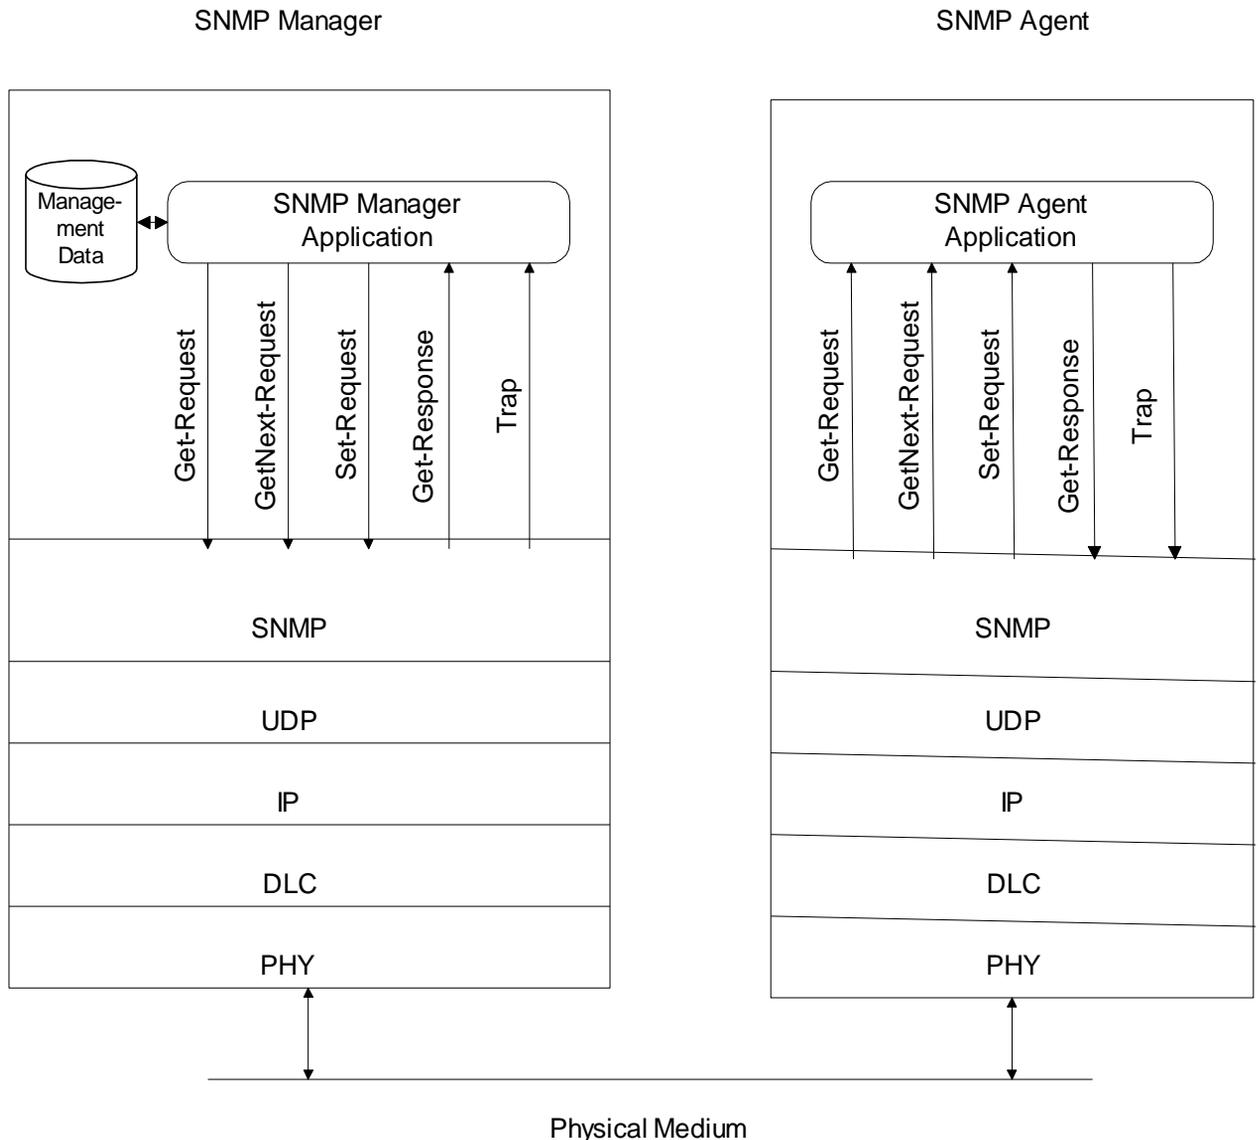

Figure 4.9 SNMP Network Management Architecture

## Notes

- Messages between manager and agent
- Direction of messages - 3 from manager and 2 from agent

# SNMP Messages

- Get-Request
  - Sent by manager requesting data from agent
- Get-Next-Request
  - Sent by manager requesting data on the next MO to the one specified
- Set-Request
  - Initializes or changes the value of network element
- Get-Response
  - Agent responds with data for get and set requests from the manager
- Trap
  - Alarm generated by an agent

---

## Notes

# Information

- Structure of Management Information (SMI) (RFC 1155)
- Managed Object
  - Scalar
  - Aggregate or tabular object
- Management Information Base (RFC 1213)

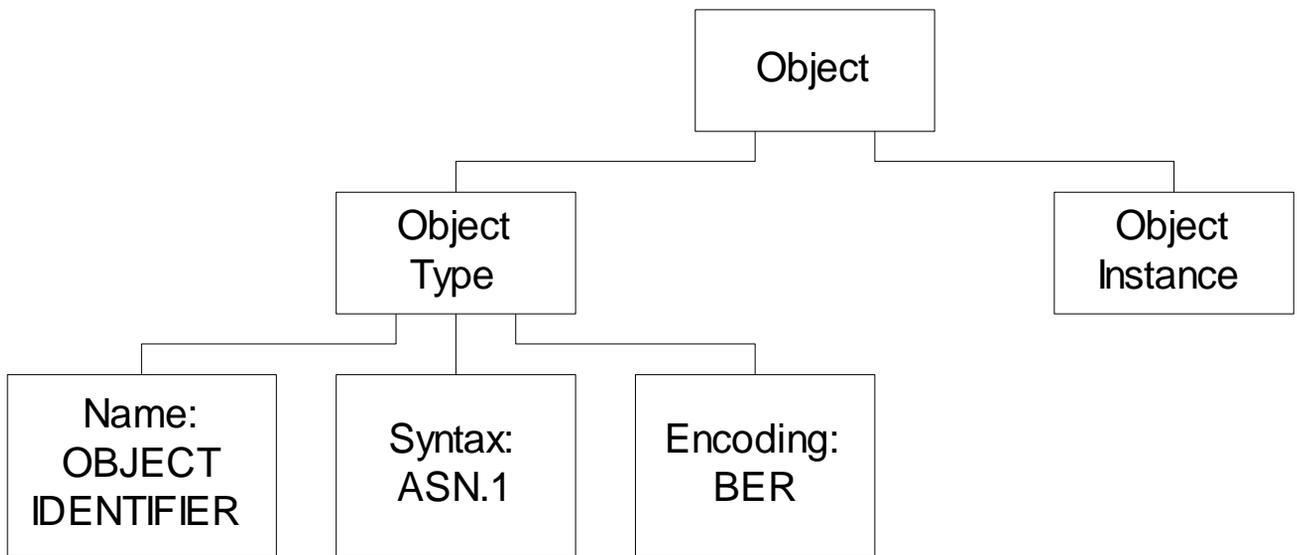

---

## Notes

- RFCs can be downloaded from [ftp.internic.net/rfc](ftp://internic.net/rfc)

---

# Managed Object

**Figure 4.10 Managed Object : Type and Instance**

---

## Notes

- Object type and data type are synonymous
- Object identifier is data type, not instance
- Object instance IP address (See Figure 4.2)

# Managed Object: Multiple Instances

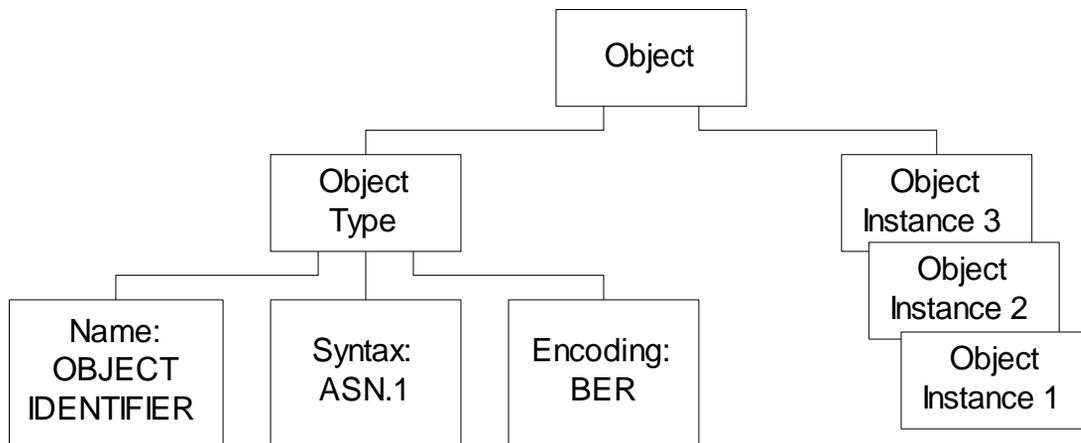

Figure 4.11 Managed Object : Type with Multiple Instances

## Notes

- All 3 Com hubs of the same version have identical identifier; they are distinguished by the IP address
- Each IP address is an instance of the object

---

# Name

Uniquely defined by

- DESCRIPTOR AND
- OBJECT IDENTIFIER

internet OBJECT IDENTIFIER ::=  
                                  {iso org(3) dod(6) 1 }.

internet OBJECT IDENTIFIER ::= {iso(1) standard(3) dod(6) internet(1)}

internet OBJECT IDENTIFIER ::= {1 3 6 1}

internet OBJECT IDENTIFIER ::= {iso standard dod internet }

internet OBJECT IDENTIFIER ::= { iso standard dod(6) internet(1) }

internet OBJECT IDENTIFIER ::= { iso(1) standard(3) 6 1 }

---

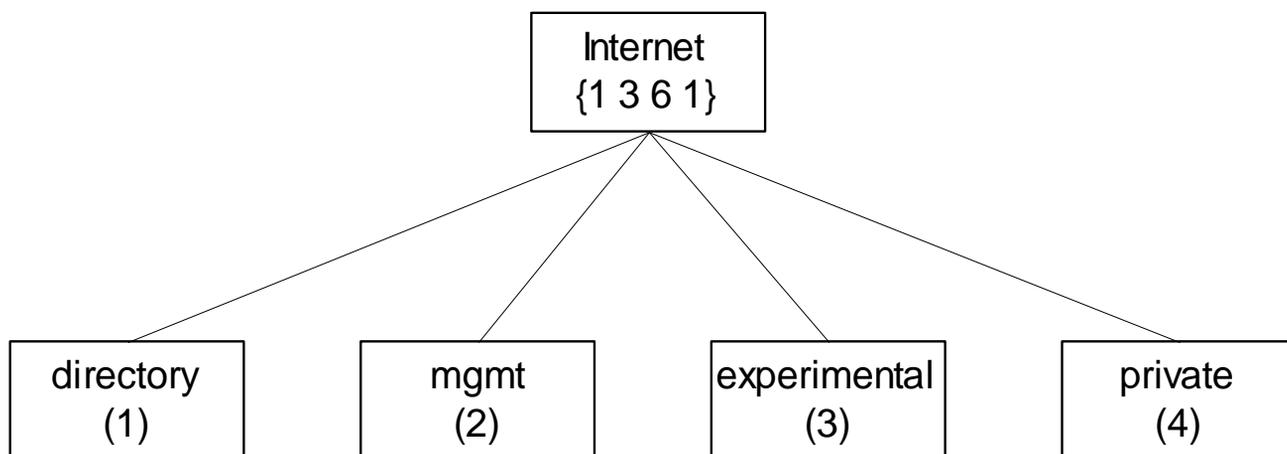

## Notes

Example

ipAddrTable      ip 20

---

# Internet Subnodes

**Figure 4.13 Subnodes under Internet Node in SNMPv1**

---

## Notes

- directory      OBJECT IDENTIFIER ::= {internet 1}
- mgmt            OBJECT IDENTIFIER ::= {internet 2}
- experimental    OBJECT IDENTIFIER ::= {internet 3}
- private          OBJECT IDENTIFIER ::= {internet 4}

---

# Private MIB Example

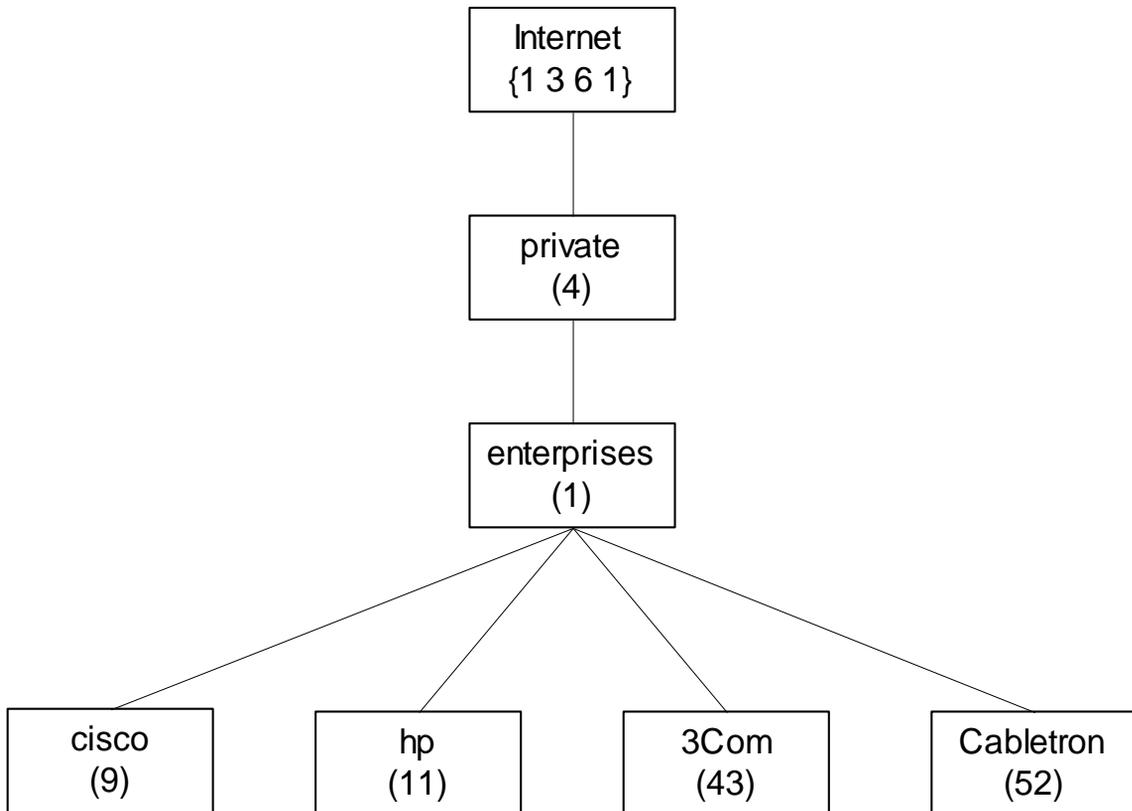

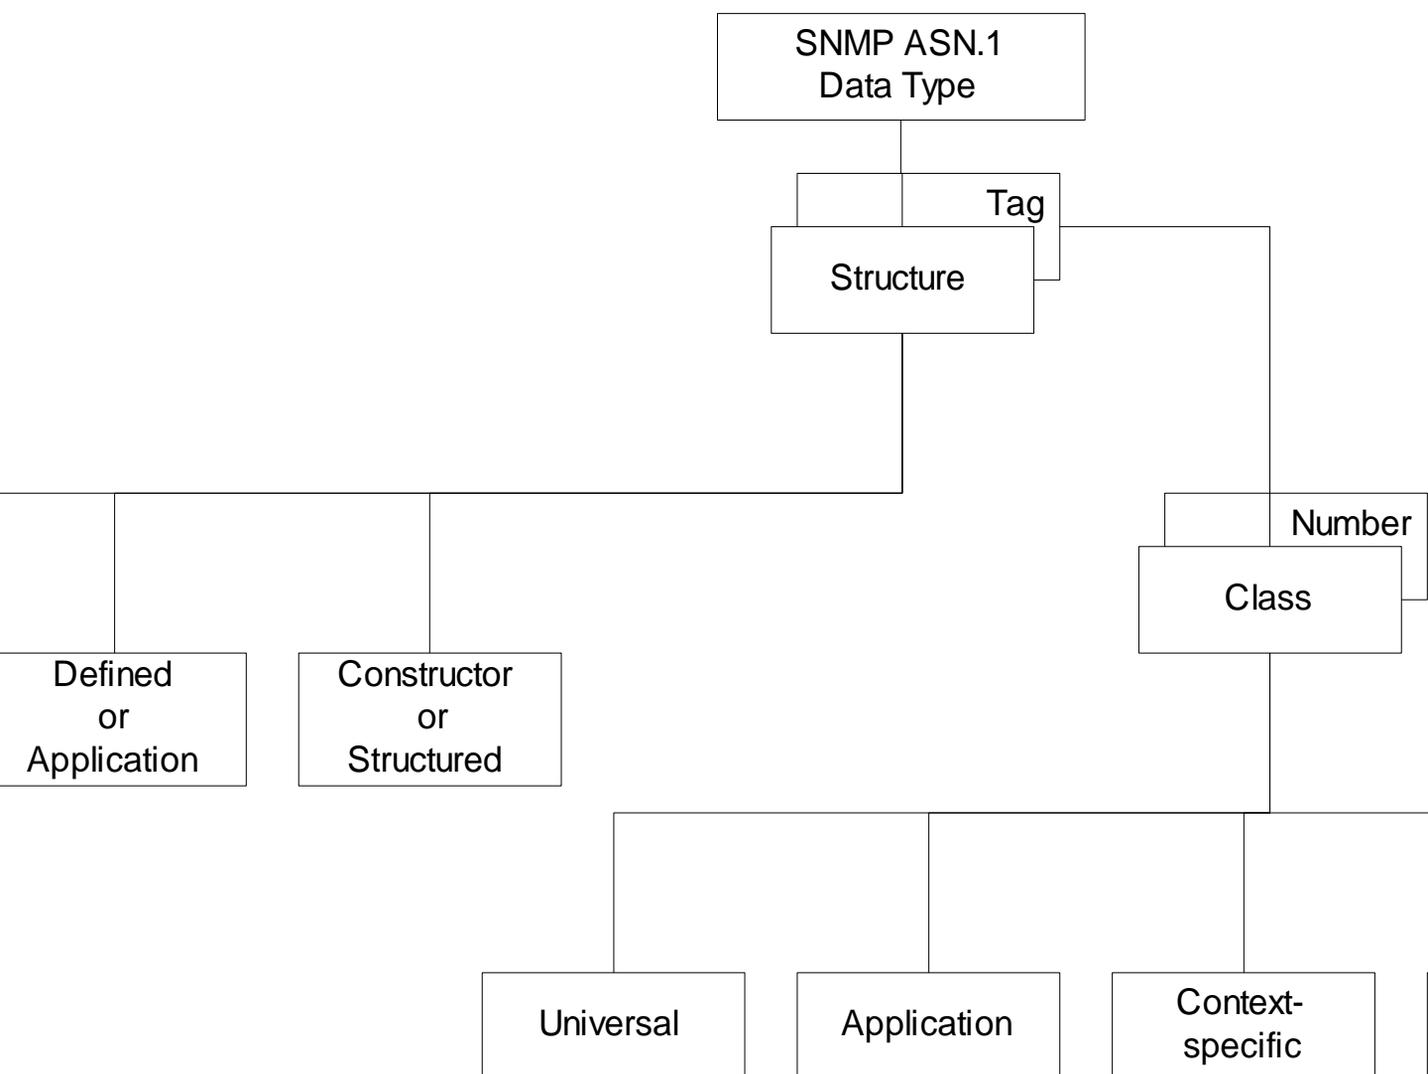

Figure 4.14 Private Subtree for Commercial Vendors

---

## Notes

- *private* MIB intended for vendor equipment
- IANA (Internet Assigned Numbers Authority) assigns identifiers

# SNMP ASN.1 Data Type

**Figure 4.15 SNMP ASN.1 Data Type**

---

# Primitive Data Types

| Structure       | Data Type         | Comments   |
|-----------------|-------------------|--|
| Primitive types | INTEGER           | Subtype INTEGER (n1..nN)<br>Special case: Enumerated<br>INTEGER type                         |
|                 | OCTET STRING      | 8-bit bytes binary and textual data<br>Subtypes can be specified by<br>either range or fixed |
|                 | OBJECT IDENTIFIER | Object position in MIB   |
|                 | NULL              | Placeholder  |

---

## Notes

- *get-request* message has NULL for value fields and *get-response* from agent has the values filled in
- subtype:
  - INTEGER (0..255)
  - OCTET STRING (SIZE 0..255)
  - OCTET STRING (SIZE 8)

---

# Enumerated

- Special case of INTEGER data type

```
error-status INTEGER {  
    noError(0)  
    tooBig(1)  
    genErr(5)  
    authorizationError(16)  
}
```

---

## Notes

- noError            NULL by convention

---

# Defined or Application Data Type

| Defined types | NetworkAddress | Not used  |
|---------------|----------------|---|
|               | IpAddress      | Dotted decimal IP address   |
|               | Counter        | Wrap-around, non-negative integer, monotonically increasing, max $2^{32} - 1$ |
|               | Gauge          | Capped, non-negative integer, increase or decrease                            |
|               | TimeTicks      | Non-negative integer in hundredths of second units                            |
|               | Opaque         | Application-wide arbitrary ASN.1 syntax, double wrapped OCTET STRING          |

---

## Notes

- Defined data types are simple or base types
- Opaque is used to create data types based on previously defined data types

# Constructor or Structured Data Type: SEQUENCE

- List maker

SEQUENCE { <type1>, <type2>, ..., <typeN> }

|   | Object              | OBJECT IDENTIFIER | ObjectSyntax |
|---|---------------------|-------------------|--------------|
| 1 | ipAdEntAddr         | {ipAddrEntry 1}   | IpAddress    |

# Aggregate Object

- A group of objects
- Also called tabular objects
- Can be represented by a table with
  - Columns of objects
  - Rows of instances

Table of Objects

List of Objects

Objects

---

## Notes

- Example: IP address table
- Consists of objects:
  - IP address
  - Interface
  - Subnet mask (which subnet this address belongs to)
  - Broadcast address (value of l.s.b. in IP broadcast address)
  - Largest IP datagram that can be assembled
- Multiple instances of these objects associated with the node

---

# Aggregate M.O. Macro: Table Object

ipAddrTable OBJECT-TYPE  
SYNTAX SEQUENCE OF IpAddrEntry  
ACCESS not-accessible  
STATUS mandatory  
DESCRIPTION  
    "The table of addressing  
    information relevant to this entity's IP  
    addresses."  
 ::= {ip 20}

---

## Notes

ipAddrTable      OBJECT-TYPE  
    ::= {ip 20}  
ipAddrEntry      OBJECT-TYPE  
    ::= {ipAddrTable 1}

---

# Aggregate M.O. Macro: Entry Object

ipAddrEntry OBJECT-TYPE

SYNTAX IpAddrEntry

ACCESS not-accessible

STATUS mandatory

DESCRIPTION

"The addressing information for one of this entity's IP addresses."

INDEX { ipAdEntAddr }

::= { ipAddrTable 1 }

IpAddrEntry ::=

SEQUENCE {

ipAdEntAddr

IpAddress,

ipAdEntIfIndex

INTEGER,

ipAdEntNetMask

IpAddress,

ipAdEntBcastAddr

INTEGER,

ipAdEntReasmMaxSize

INTEGER (0..65535)

---

## Notes

- Index *ipAdEntAddr* uniquely identifies an instance
- May require more than one object in the instance to uniquely identify it

---

# Aggregate M.O. Macro: Columnar Objects

ipAdEntAddr OBJECT-TYPE

SYNTAX IpAddress

ACCESS read-only

STATUS mandatory

DESCRIPTION

"The IP address to which this entry's  
addressing information pertains."

::= { ipAddrEntry 1 }

ipAdEntReasmMaxSize OBJECT-TYPE

SYNTAX INTEGER (0..65535)

ACCESS read-only

STATUS mandatory

DESCRIPTION

"The size of the largest IP datagram which this  
entity can re-assemble from incoming IP  
fragmented datagrams received on this interface."

::= { ipAddrEntry 5 }

---

## Notes

---

# Tabular Representation of Aggregate Object

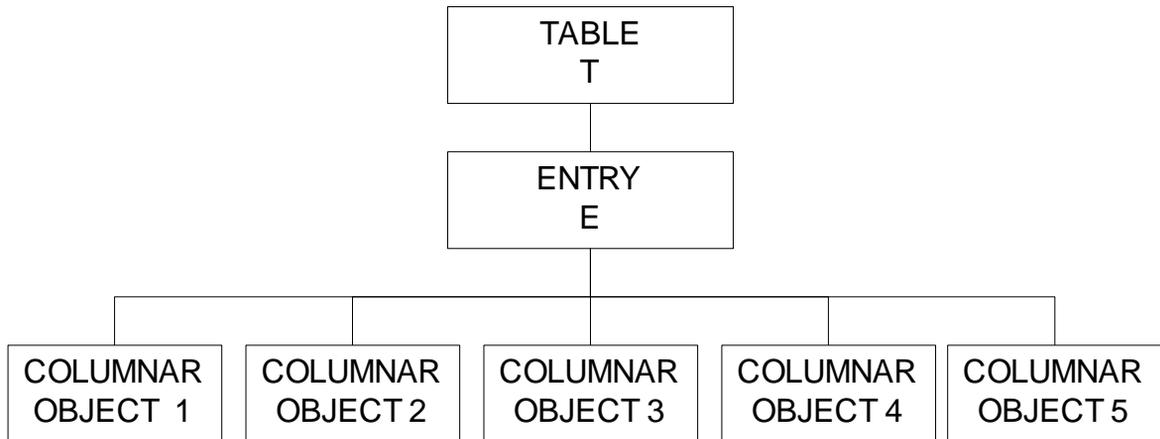

Figure 4.22(a) Multiple Instance Managed Object

---

## Notes

- The objects *TABLE T* and *ENTRY E* are objects that are logical objects. They define the grouping and are not accessible
- Columnar objects are objects that represent the attributes and hence are accessible
- Each instance of *E* is a row of columnar objects 1 through 5
- Multiple instances of *E* are represented by multiple rows

# Tabular Representation of Aggregate Object

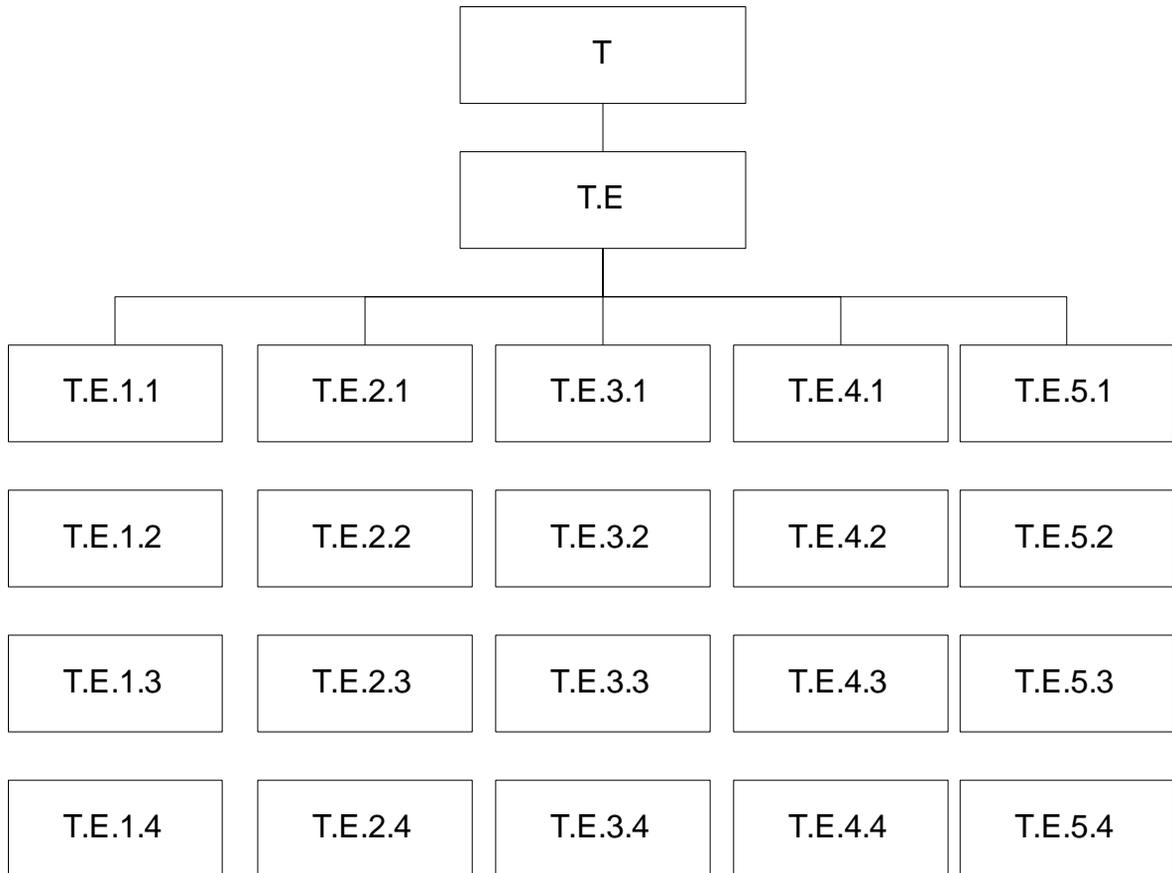

Figure 4.22(b) Example of 5 Columnar Object with 4 Instances (rows)

## Notes

- Notice that the column-row numeric designation is reverse of what we are used to as row-column

# Multiple Instances of Aggregate Managed Object

```

ipAddrTable {1.3.6.1.2.1.4.20}
  ipAddrEntry (1)
    ipAdEntAddr (1)
    ipAdEntIfIndex (2)
    ipAdEntNetMask (3)
    ipAdEntBcastAddr (4)
    ipAdEntReasmMaxSize (5)

```

Columnar object ID of ipAdEntBcastAddr is (1.3.6.1.2.1.4.20.1.4):

```

iso org dod internet mgmt mib ip ipAddrTable ipAddrEntry ipAdEntBcastAddr
1 3 6 1 2 1 4 20 1 4

```

## Notes

# MIB

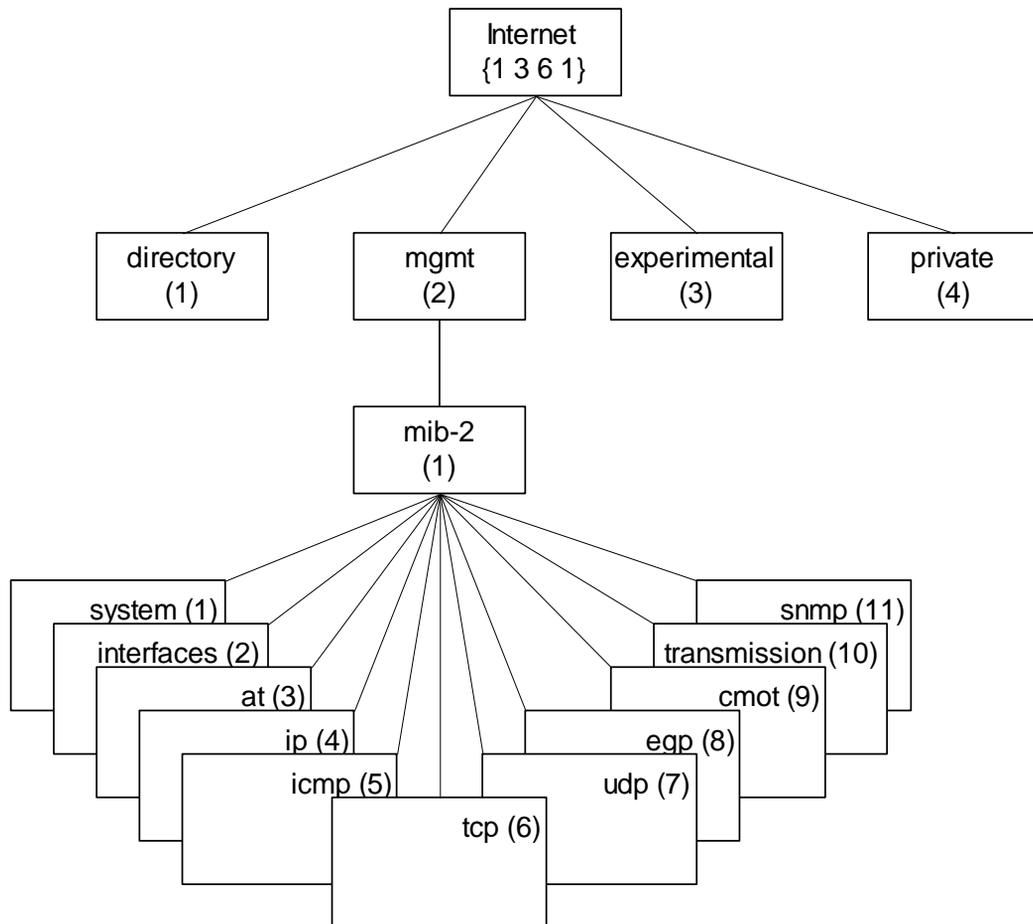

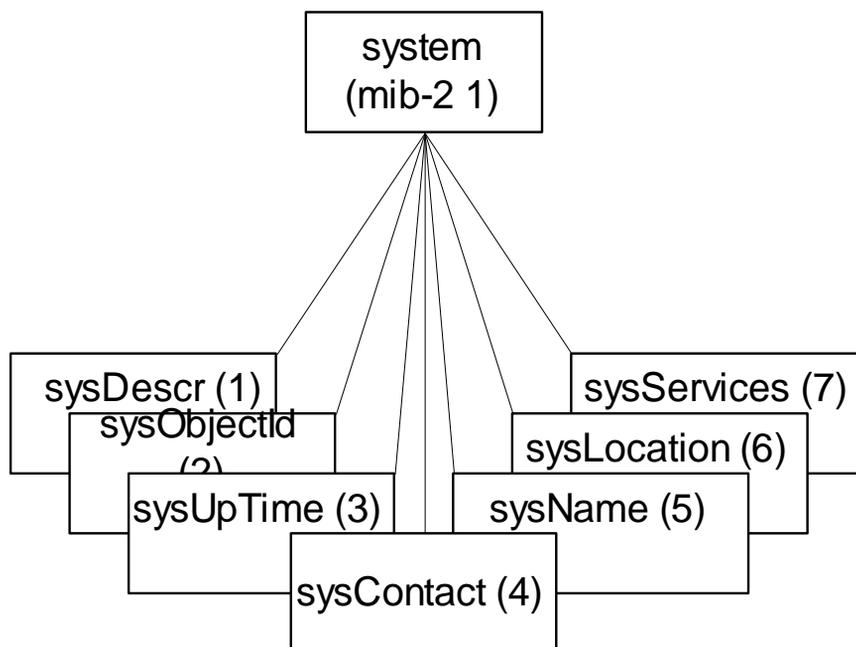

Figure 4.26 Internet MIB-II Group

## Notes

- MIB-II (RFC 1213) is superset of MIB-I
- Objects that are related grouped into object groups
- MIB module comprises module name, imports from other modules, and definitions of current module
- RFC 1213 defines eleven groups; expanded later

# System Group

**Figure 4.27 System Group**

## Notes

| Entity      | OID      | Description (brief)   |
|-------------|----------|---|
| sysDescr    | system 1 | Textual description   |
| sysObjectID | system 2 | OBJECT IDENTIFIER of the entity                             |
| sysUpTime   | system 3 | Time (in hundredths of a second since last reset)           |
| sysContact  | system 4 | Contact person for the node                                 |
| sysName     | system 5 | Administrative name of the system                           |
| sysLocation | system 6 | Physical location of the node                               |
| sysServices | system 7 | Value designating the layer services provided by the entity |

---

# sysServices

sysServices OBJECT-TYPE

SYNTAX INTEGER (0..127)

ACCESS read-only

STATUS mandatory

DESCRIPTION

"A value which indicates the set of services that this entity primarily offers.

The value is a sum. This sum initially takes the value zero, Then, for each layer, L, in the range 1 through 7, that this node performs transactions for,  $2^{L-1}$  is added to the sum. For example, a node which performs primarily routing functions would have a value of 4 ( $2^{(3-1)}$ ). In contrast, a node which is a host offering application services would have a value of 72 ( $2^{(4-1)} + 2^{(7-1)}$ ). Note that in the context of the Internet suite of protocols, values should be calculated accordingly:

layer functionality

- 1 physical (e.g., repeaters)
- 2 datalink/subnetwork (e.g., bridges)
- 3 internet (e.g., IP gateways)
- 4 end-to-end (e.g., IP hosts)
- 7 applications (e.g., mail relays)

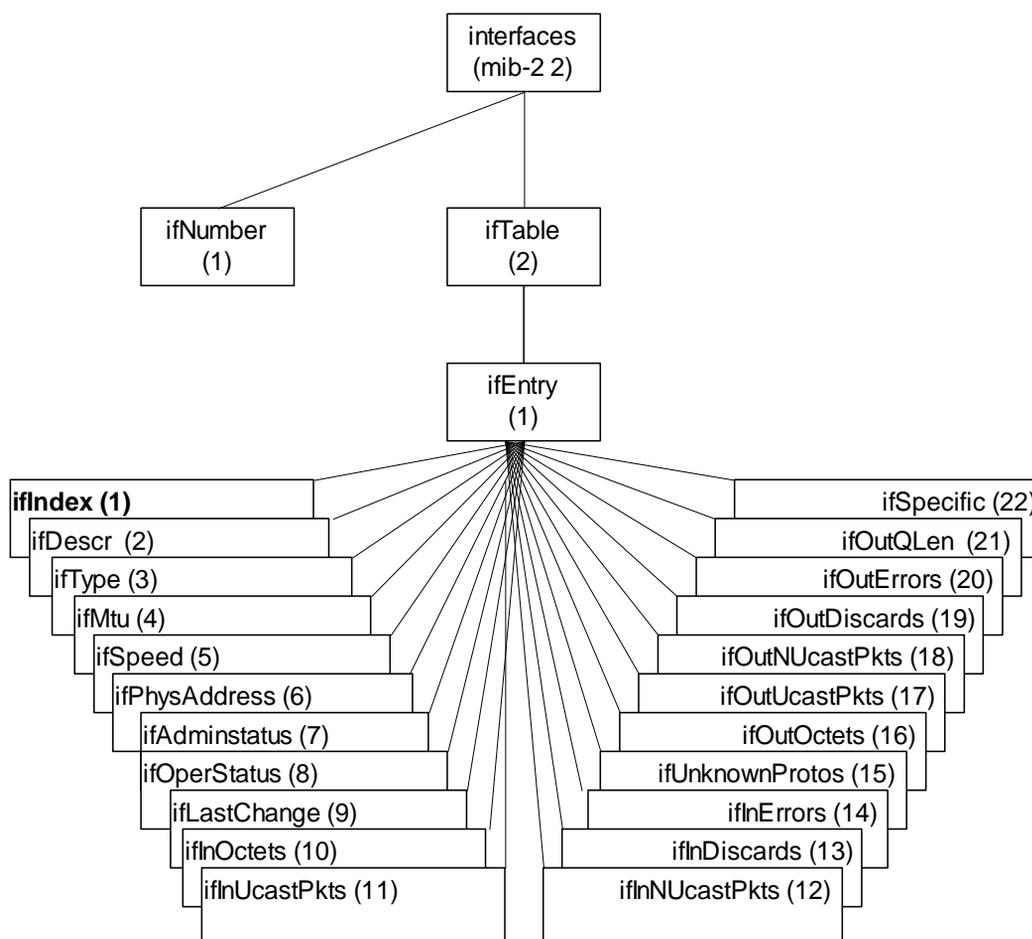

For systems including OSI protocols, layers 5 and 6 may also be counted."

| tcpconnEntry               | TcpConnTable 1 | Information about a particular TCP connection |
| tcpConnState               | TcpConnEntry 1 | State of the TCP connection                   |
| <b>tcpConnLocalAddress</b> | TcpConnEntry 2 | Local IP address                              |
| <b>tcpConnLocalPort</b>    | TcpConnEntry 3 | Local port number                             |
| <b>tcpConnRemAddress</b>   | TcpConnEntry 4 | Remote IP address                             |
| <b>tcpConnRemPort</b>      | TcpConnEntry 5 | Remote port number                            |

# UDP Group

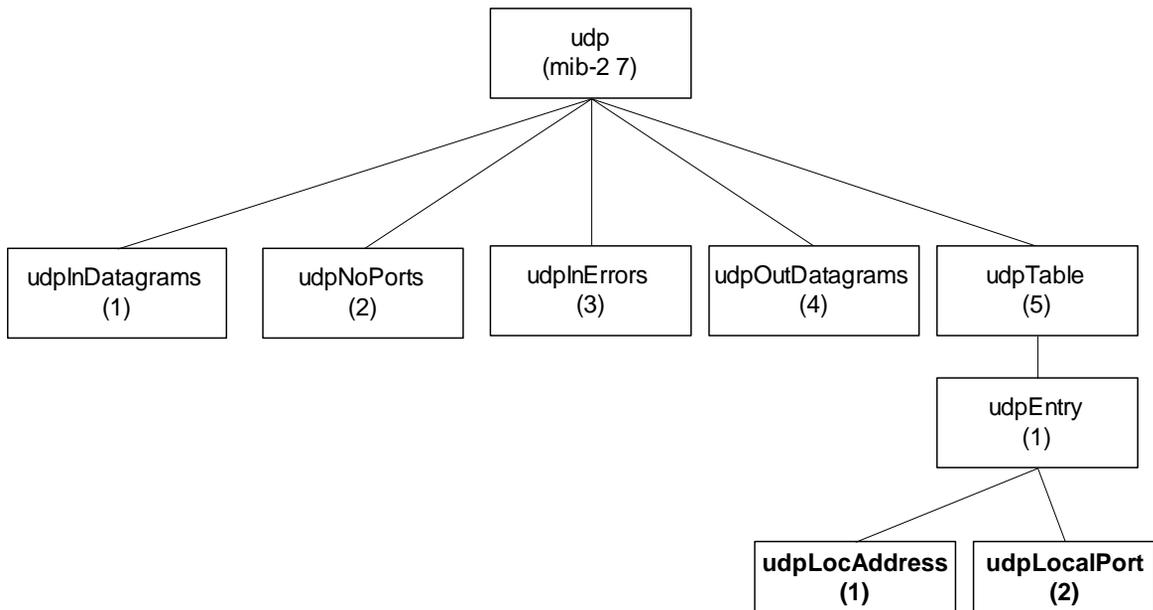

Figure 4.37 UDP Group

## Notes

- Connectionless transport protocol group
- Has one table, UDP table

| Entity                 | OID        | Description (brief)  |
|------------------------|------------|--|
| udpInDatagrams         | udp 1      | Total number of datagrams delivered to the users                     |
| udpNoPorts             | udp 2      | Total number of received datagrams for which there is no application |
| udpInErrors            | udp 3      | Number of received datagrams with errors                             |
| udpOutDatagrams        | udp 4      | Total number of datagrams sent                                       |
| udpTable               | udp 5      | UDP Listener table   |
| udpEntry               | udpTable 1 | Information about a particular connection or UDP listener            |
| <b>udpLocalAddress</b> | udpEntry 1 | Local IP address   |
| <b>udpLocalPort</b>    | udpEntry 2 | Local UDP port   |

# Chapter 5

## SNMPv1:

# Communication and Functional Models

# SNMP Architecture

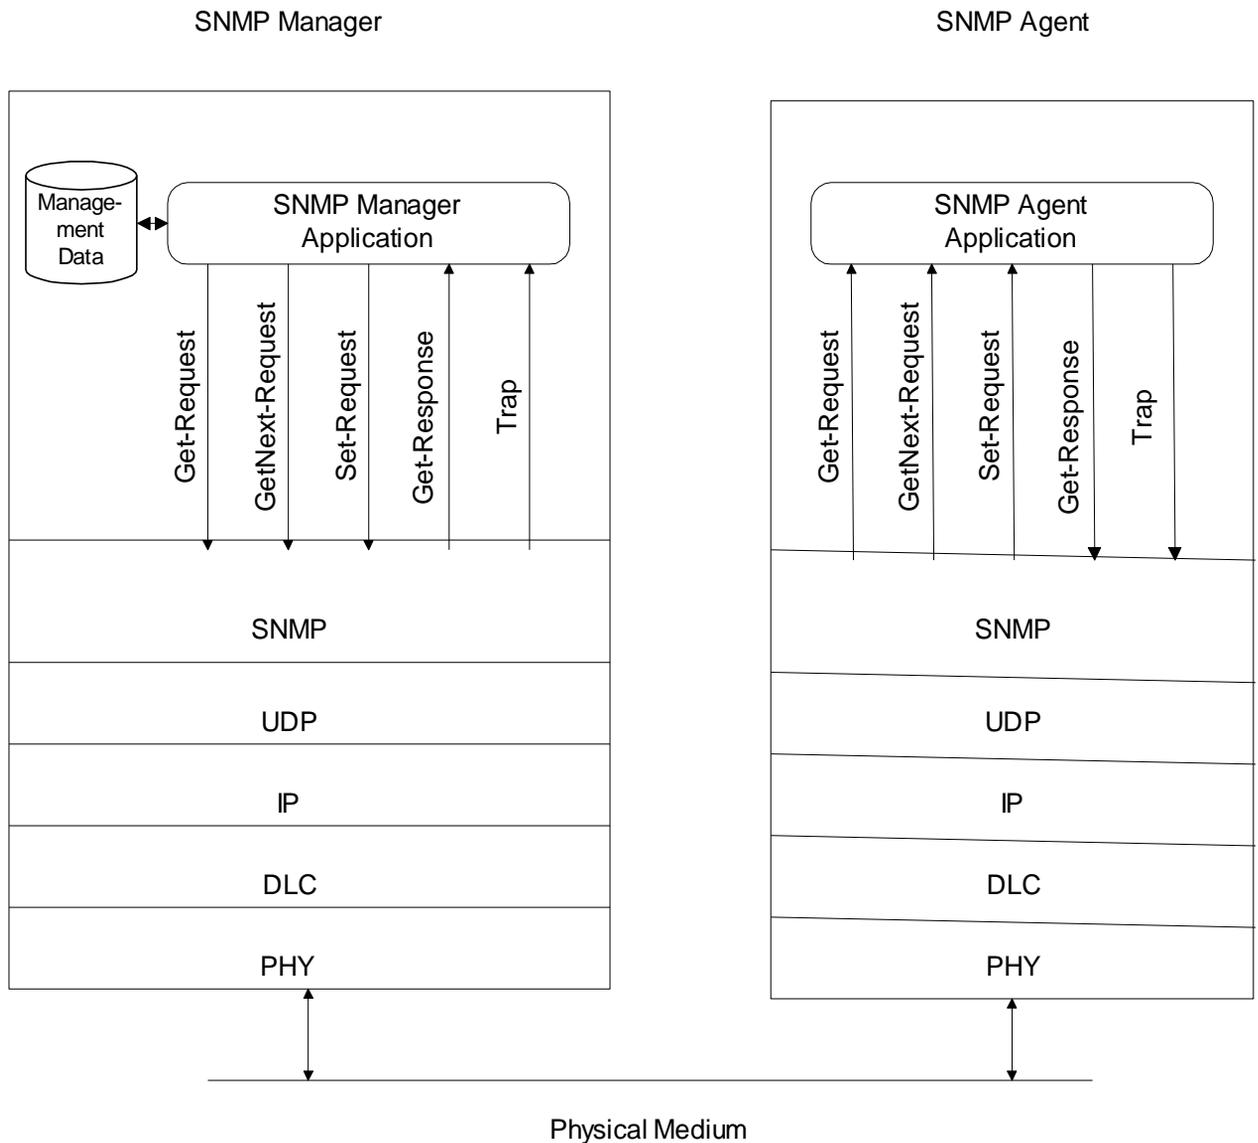

Figure 4.9 SNMP Network Management Architecture

## Notes

- Truly *simple* network management protocol
- Five messages, three from manager and two from agent

# SNMP Messages

- Get-Request
- Get-Next-Request
- Set-Request
- Get-Response
- Trap
  - Generic trap
  - Specific trap
  - Time stamp

---

## Notes

- Generic trap
  - coldStart
  - warmStart
  - linkDown
  - linkUp
  - authenticationfailure
  - egpNeighborLoss
  - enterpriseSpecific
- Specific trap
  - for special measurements such as statistics
- Time stamp: Time since last initialization

# Administrative Model

- Based on community profile and policy
- SNMP Entities:
  - SNMP application entities
    - Reside in management stations and network elements
    - Manager and agent
  - SNMP protocol entities
    - Communication processes (PDU handlers)
    - Peer processes that support application entities

---

## Notes

# SNMP Community

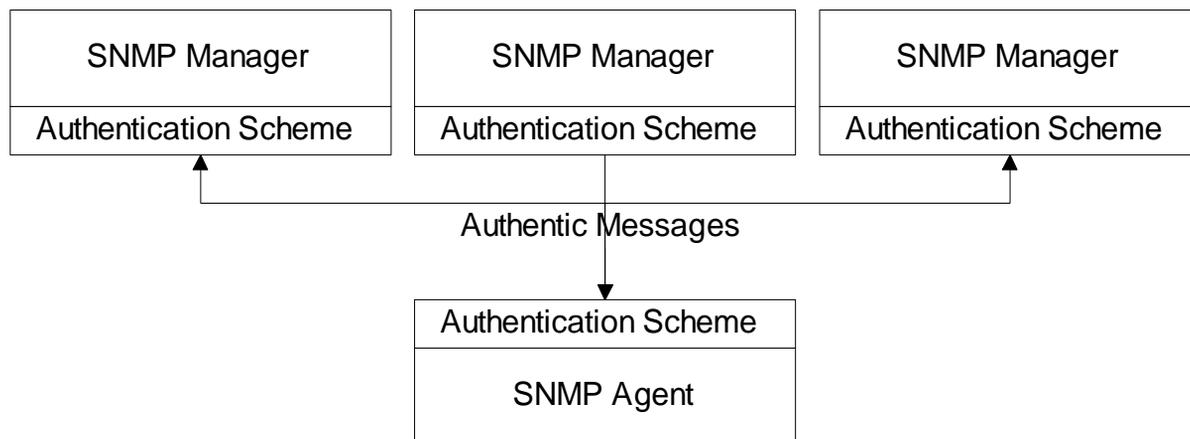

Figure 5.1 SNMP Community

## Notes

- Security in SNMPv1 is community-based
- Authentication scheme in manager and agent
- Community: Pairing of two application entities
- Community name: String of octets
- Two applications in the same community communicate with each other
- Application could have multiple community names
- Communication is not secured in SNMPv1 - no encryption

# Community Profile

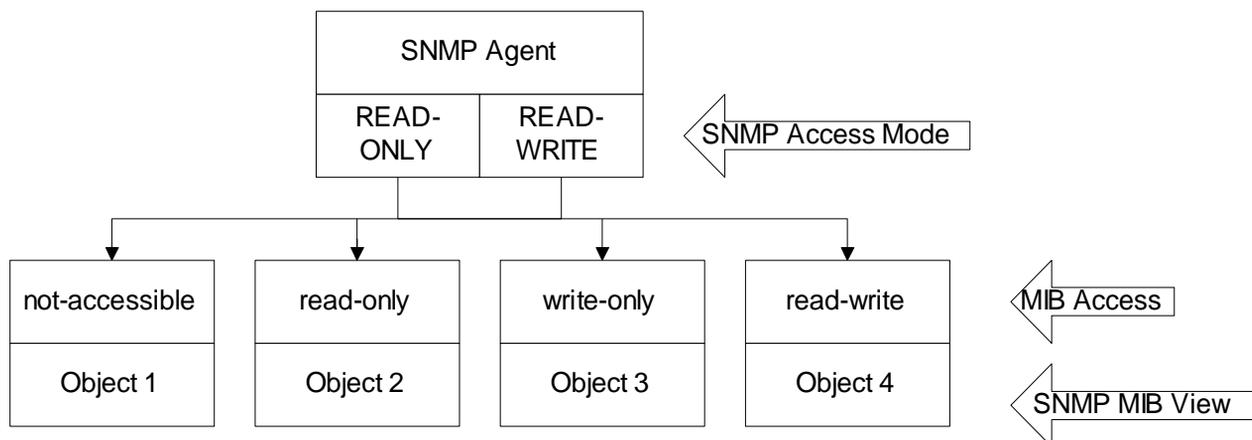

Figure 5.2 SNMP Community Profile

## Notes

- MIB view
  - An agent is programmed to view only a subset of managed objects of a network element
- Access mode
  - Each community name is assigned an access mode:: read-only and read-write
- Community profile: MIB view + access mode
- Operations on an object determined by community profile and the access mode of the object
- Total of four access privileges
- Some objects, such as table and table entry are non-accessible

# Administration Model

- Administration model is SNMP access policy
- SNMP community paired with SNMP community profile is SNMP access policy

---

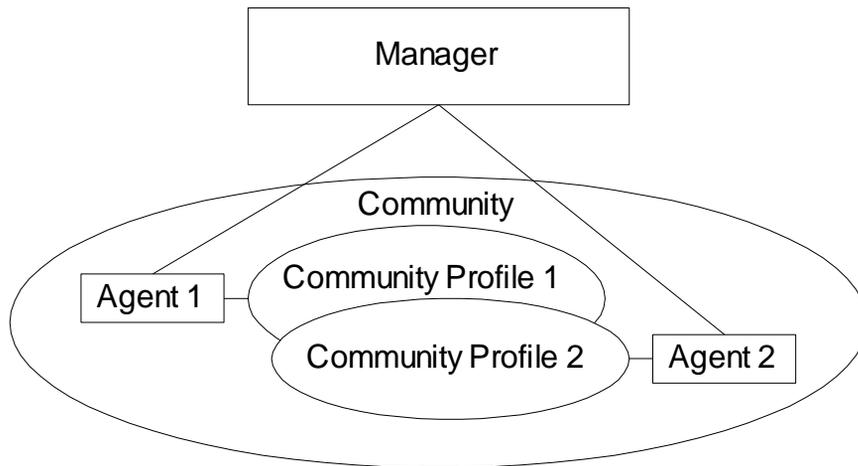

## Notes

Parameters:

- Community / communities
- Agent / Agents
- Manager / managers

---

# Access Policy

---

## Notes

- Manager manages Community 1 and 2 network components via Agents 1 and 2
- Agent 1 has only view of Community Profile 1, e.g. Cisco components
- Agent 2 has only view of Community Profile 2, e.g. 3Com components
- Manager has total view of both Cisco and 3Com components

# Generalized Administration Model

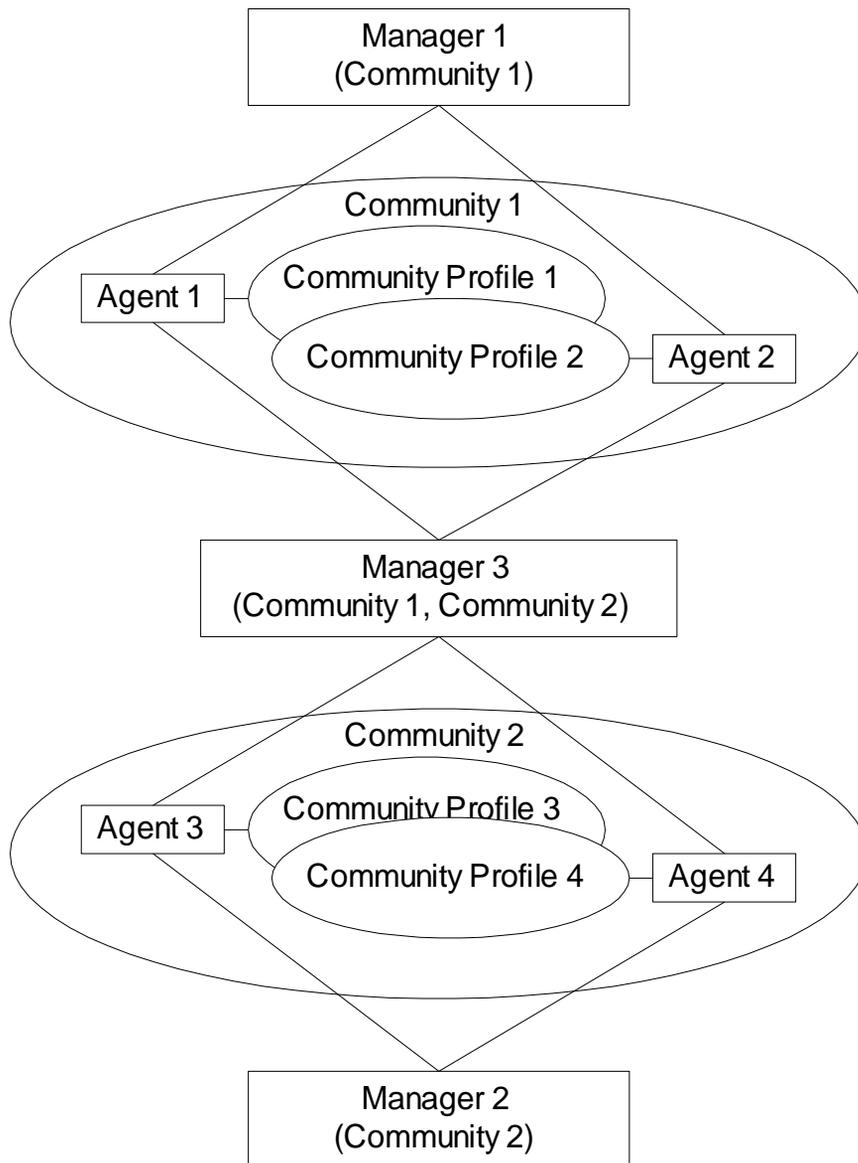

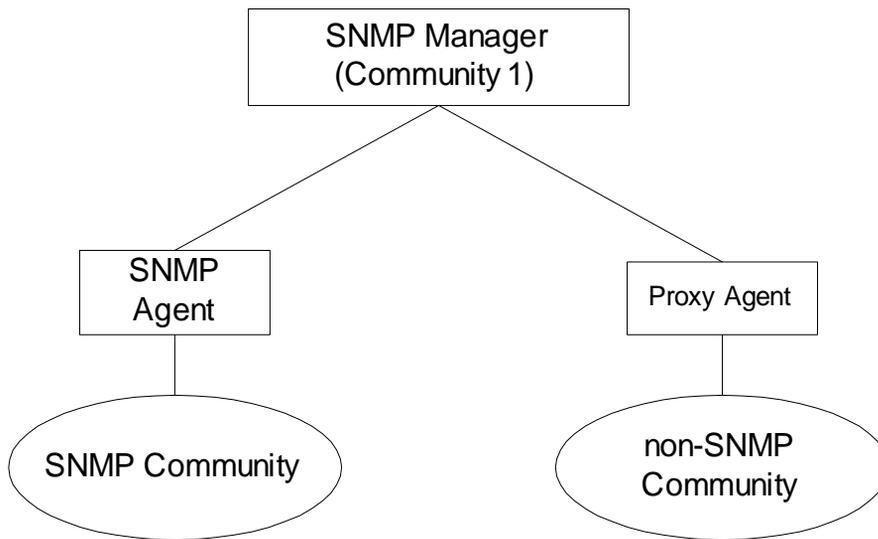

Figure 5.3 SNMP Access Policy

## Notes

- Manager 1 manages community 1, manager 2 community 2, and manager 3 (MoM) both communities 1 and 2

---

# Proxy Access Policy

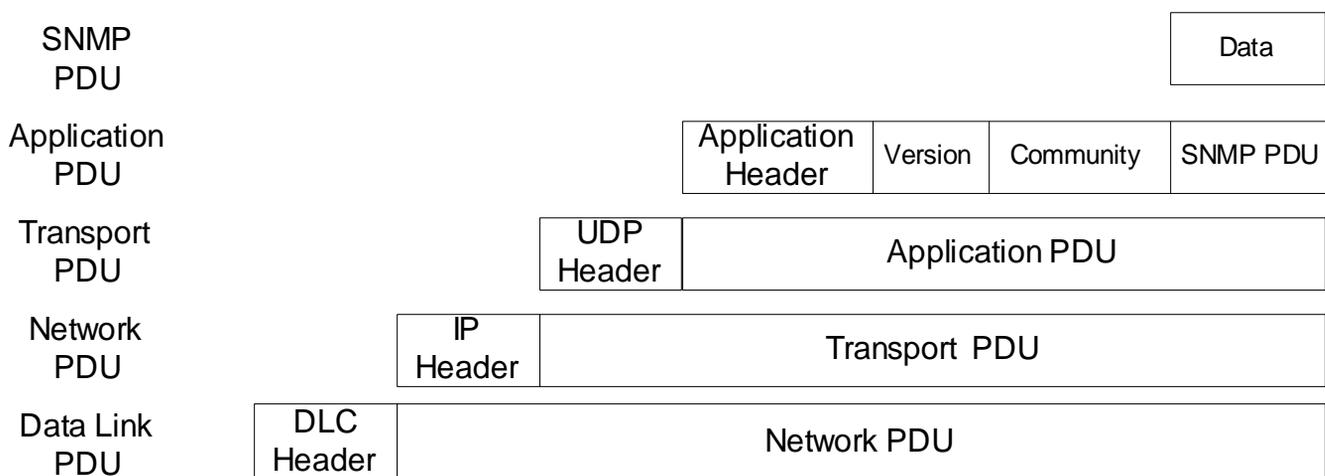

**Figure 5.4 SNMP Proxy Access Policy**

---

## Notes

- Proxy agent enables non-SNMP community elements to be managed by an SNMP manager.
- An SNMP MIB is created to handle the non-SNMP objects

# Protocol Entities

**Figure 5.5 Encapsulated SNMP Message**

## Notes

- Protocol entities support application entities
- Communication between remote peer processes
- Message consists of
  - Version identifier
  - Community name
  - Protocol Data Unit
- Message encapsulated and transmitted

# Get and Set PDU

|          |           |              |             |                |                 |     |                |                 |
|----------|-----------|--------------|-------------|----------------|-----------------|-----|----------------|-----------------|
| PDU Type | RequestID | Error Status | Error Index | VarBind 1 name | VarBind 1 value | ... | VarBind n name | VarBind n value |
|----------|-----------|--------------|-------------|----------------|-----------------|-----|----------------|-----------------|

Figure 5.8 Get and Set Type PDUs

## Notes

- VarBindList: multiple instances of VarBind pairs

PDUs ::=

```

CHOICE {
    get-request           GetRequest-PDU,
    get-next-request     GetNextRequest-PDU,
    get-response         GetResponse-PDU,
    set-request          SetRequest-PDU,
    trap                 Trap-PDU
}

```

PDU Types: enumerated INTEGER

```

get-request           [0]
get-next-request     [1]
set-request          [2]
get-response         [3]
trap                 [4]

```

---

# Error in Response

```
ErrorStatus ::=
  INTEGER {
    noError(0)
    tooBig(1)
    noSuchName(2)
    bad value(3)
    readOnly(4)
    genErr(5)
  }
```

Error Index: No. of VarBind that the first error occurred

---

## Notes

# Trap PDU

|          |            |               |                   |                    |           |                |                 |     |                |                 |
|----------|------------|---------------|-------------------|--------------------|-----------|----------------|-----------------|-----|----------------|-----------------|
| PDU Type | Enterprise | Agent Address | Generic Trap Type | Specific Trap Type | Timestamp | VarBind 1 name | VarBind 1 value | ... | VarBind n name | VarBind n value |
|----------|------------|---------------|-------------------|--------------------|-----------|----------------|-----------------|-----|----------------|-----------------|

| Generic Trap Type        | Description (brief)  |
|--------------------------|--|
| coldStart(0)             | Sending protocol entity is reinitializing itself; agent's configuration or protocol entity implementation may be altered |
| warmStart(1)             | Sending protocol entity is reinitializing itself; agent configuration or protocol entity implementation not altered      |
| linkDown(2)              | Failure of one of the communication links  |
| linkUp(3)                | One of the links has come up   |
| authenticationFailure(4) | Authentication failure   |
| egpNeighborLoss(5)       | Loss of EGP neighbor   |
| enterpriseSpecific(6)    | Enterprise-specific trap   |

## Notes

- Enterprise and agent address pertain to the system generating the trap
- Seven generic traps specified by enumerated INTEGER
- Specific trap is a trap not covered by enterprise specific trap
- time stamp indicates elapsed time since last re-initialization

# SNMP Operations

**Figure 5.10 Get-Request Operation for System Group**

---

# MIB for Get-Next-Request

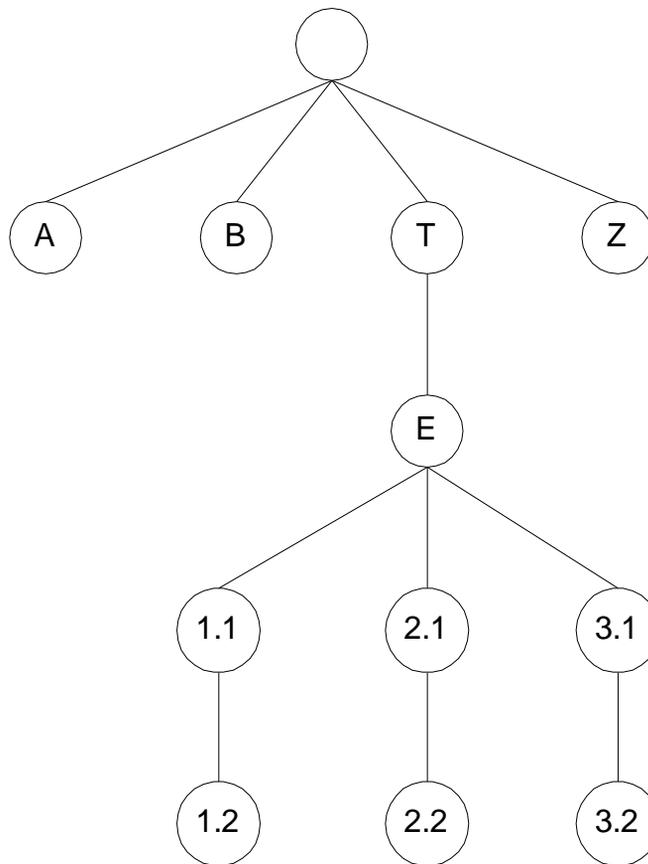

Figure 5.12 MIB for Operation Sequences in Figures 5.13 and 5.15

---

## Notes

---

# Lexicographic Order

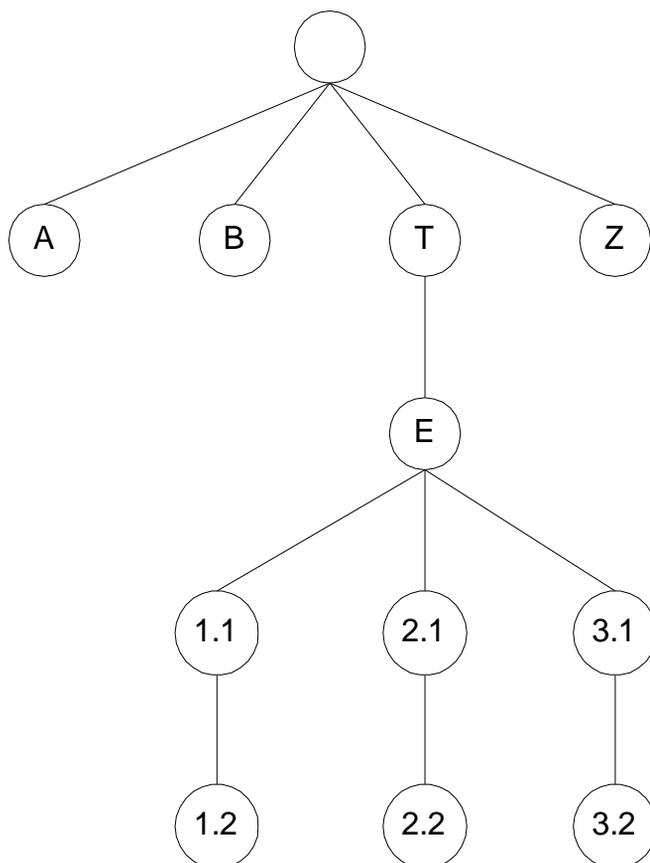

| Numerical Order | Lexicographic order |
|-----------------|---------------------|
| 1               | 1                   |
| 2               | 1118                |
| 3               | 115                 |
| 9               | 126                 |
| 15              | 15                  |
| 22              | 2                   |
| 34              | 22                  |
| 115             | 250                 |
| 126             | 2509                |
| 250             | 3                   |
| 321             | 321                 |
| 1118            | 34                  |
| 2509            | 9                   |

---

## Notes

- Procedure for ordering:
  - Start with leftmost digit as first position
  - Before increasing the order in the first position, select the lowest digit in the second position
  - Continue the process till the lowest digit in the last position is captured
  - Increase the order in the last position until all the digits in the last position are captured
  - Move back to the last but one position and repeat the process
  - Continue advancing to the first position until all the numbers are ordered
- Tree structure for the above process

# MIB Lexicographic Order

## Notes

|     |     |
|-----|-----|
| A   | 3.1 |
| B   | 3.2 |
| T   | Z   |
| E   |     |
| 1.1 |     |
| 1.2 |     |
| 2.1 |     |
| 2.2 |     |

# A More Complex MIB Example

system.sysDescr.0 = "SunOS noc1 5.5.1 Generic_103640-08  
sun4u"  
system.sysObjectID.0 = E:hp.2.3.10.1.2  
system.sysUpTime.0 = 247396453  
system.sysContact.0 = "Brandon Rhodes"  
system.sysName.0 = "noc1"  
system.sysLocation.0 = "BTC NM Lab"  
system.sysServices.0 = 72
```

**Figure 5.17(b) Get-Response Message from Agent-to-Manager (After)**

# SNMP MIB

**Figure 5.21 SNMP Group**

Note: Most of the MIB objects were not used and hence deprecated in SNMPv2

# Chapter 7

## SNMPv3

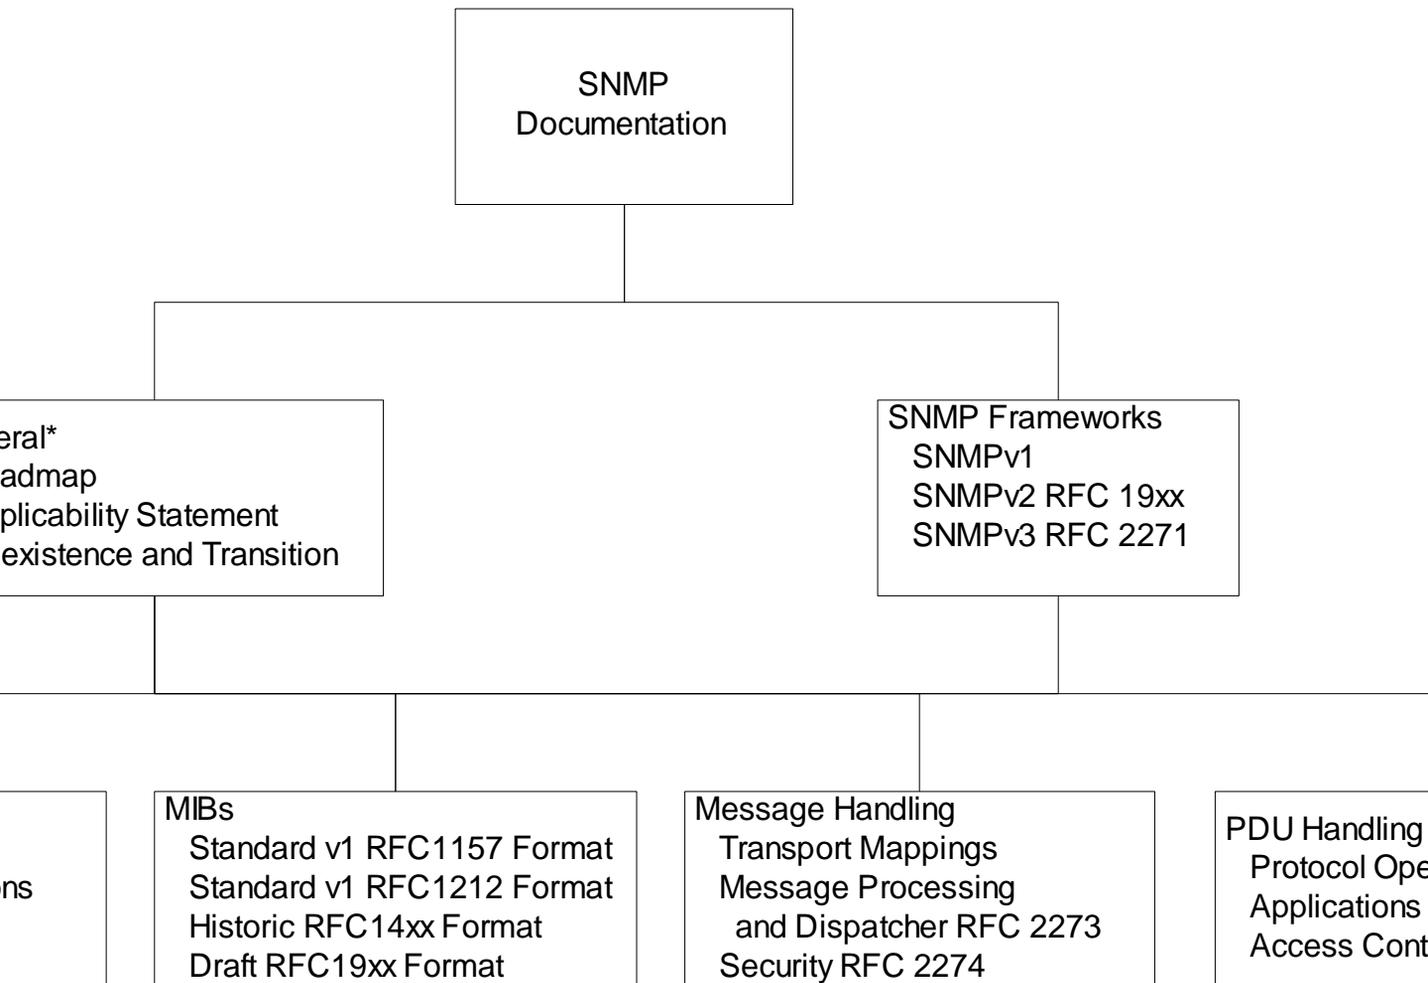

# Key Features

- Modularization of document
- Modularization of architecture
- SNMP engine
- Security feature
  - Secure information
  - Access control

---

## Notes

# Documentation

**Figure 7.1 SNMP Documentation (recommended in SNMPv3)**

- Compare this to the document organization in Chapter 4

# Architecture

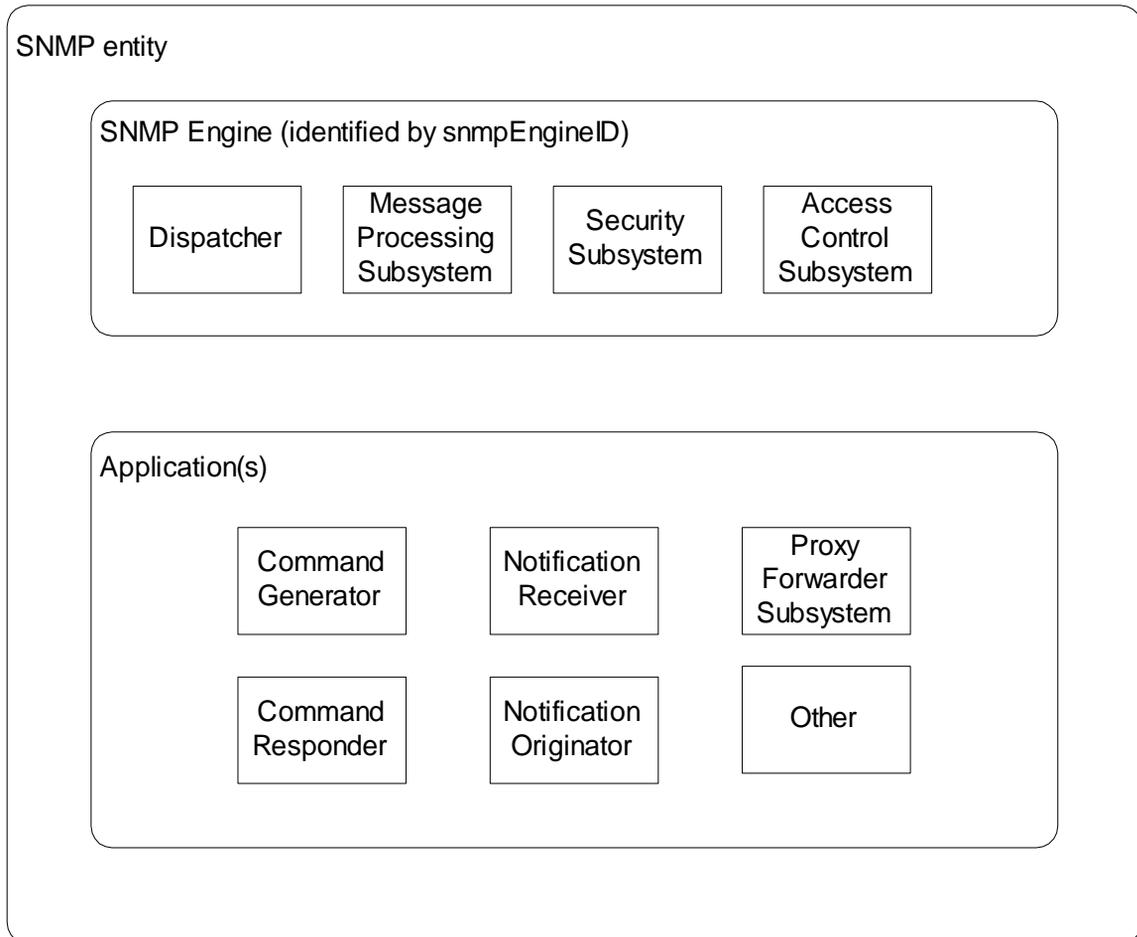

Figure 7.2 SNMPv3 Architecture

## Notes

- SNMP entity is a node with an SNMP management element - either an agent or manager or both
- Three names associated with an entity
  - Entities: SNMP engine
  - Identities: Principal and security name
  - Management Information: Context engine

# SNMP Engine ID

|                  | 1st bit |                               |                                  |   |
|------------------|---------|-------------------------------|----------------------------------|---|
| SNMPv1<br>SNMPv2 | 0       | Enterprise ID<br>(1-4 octets) | Enterprise method<br>(5th octet) | Function of the method<br>(6-12 octets) |
| SNMPv3           | 1       | Enterprise ID<br>(1-4 octets) | Format indicator<br>(5th octet)  | Format<br>(variable number of octets)   |

Figure 7.3 SNMP Engine ID

## Notes

- Each SNMP engine has a unique ID: *snmpEngineID*
- Acme Networks {enterprises 696}
- SNMPv1 *snmpEngineID* '000002b8'H
- SNMPv3 *snmpEngineID* '800002b8'H  
(the 1st octet is 1000 0000)

# SNMPv3 Engine ID Format

## 5th Octet

**Table 7.2 SNMPv3 Engine ID Format (5th octet)**

|         |  |
|---------|--|
| 0       | Reserved, unused   |
| 1       | IPv4 address (4 octets)  |
| 2       | IPv6 (16 octets)<br>Lowest non-special IP address                  |
| 3       | MAC address (6 octets)<br>Lowest IEEE MAC address, canonical order |
| 4       | Text, administratively assigned<br>Maximum remaining length 27     |
| 5       | Octets, administratively assigned<br>Maximum remaining length 27   |
| 6-127   | Reserved, unused   |
| 128-255 | As defined by the enterprises<br>Maximum remaining length 27       |

## Notes

- For SNMPv1 and SNMPv2:
  - Octet 5 is the method
  - Octet 6-12 is IP address
- Examples: IBM host IP address 10.10.10.10  
 SNMPv1: 00 00 00 02 01 0A 0A 0A 0A 00 00 00  
 SNMPv3: 10 00 00 02 02 00 00 00 00 00 00 00 00 0A 0A 0A 0A

---

# Dispatcher

SNMP Engine (identified by snmpEngineID)

Message  
Processing  
Subsystem

Security  
Subsystem

Access  
Control  
Subsystem

- One dispatcher in an SNMP engine
- Handles multiple version messages
- Interfaces with application modules, network, and message processing models
- Three components for three functions
  - Transport mapper delivers messages over the transport protocol
  - Message Dispatcher routes messages between network and appropriate module of MPS
  - PDU dispatcher handles messages between application and MSP

---

## Notes

---

# Message Processing Subsystem

SNMP Engine (identified by snmpEngineID)

Dispatcher

Message  
Processing  
Subsystem

Security  
Subsystem

Access  
Control  
Subsystem

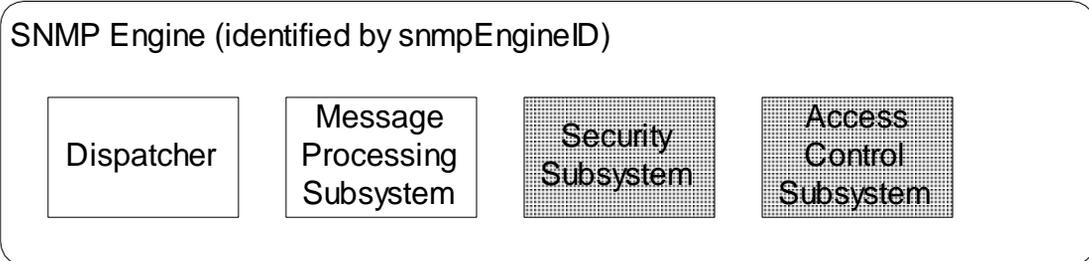

- Contains one or more Message Processing Models
- One MPM for each SNMP version
- SNMP version identified in the header

---

## Notes

---

# Security and Access Control

- Security at the message level
  - Authentication
  - Privacy of message via secure communication
- Flexible access control
  - Who can access
  - What can be accessed
  - Flexible MIB views

---

## Notes

# Applications

Application(s)

Command  
Generator

Notification  
Receiver

Proxy  
Forwarder  
Subsystem

Command  
Responder

Notification  
Originator

Other

| <u>Application</u>                        | <u>Example</u>       |
|---|----------------------|
| • Command generator                       | get-request          |
| • Command responder                       | get-response         |
| • Notification receiver                   | trap generation      |
| • Notification receiver                   | trap processing      |
| • Proxy Forwarder<br>(SNMP versions only) | get-bulk to get-next |
| • Other                                   | Special application  |

## Notes

---

# Names

- SNMP Engine ID            snmpEngineID
- Principal                    principal  
    Who: person or group or application
- Security Name              securityName  
    human readable name
- Context Engine ID         contextEngineID
- Context Name                contextName

---

## Notes

- An SNMP agent can monitor more than one network element (context)

Examples:

SNMP Engine ID            IP address

Principal                  John Smith

Security Name              Administrator

Principal                  Li, David, Kristen, Rashmi,

Security Name              Operator

# Abstract Service Interface

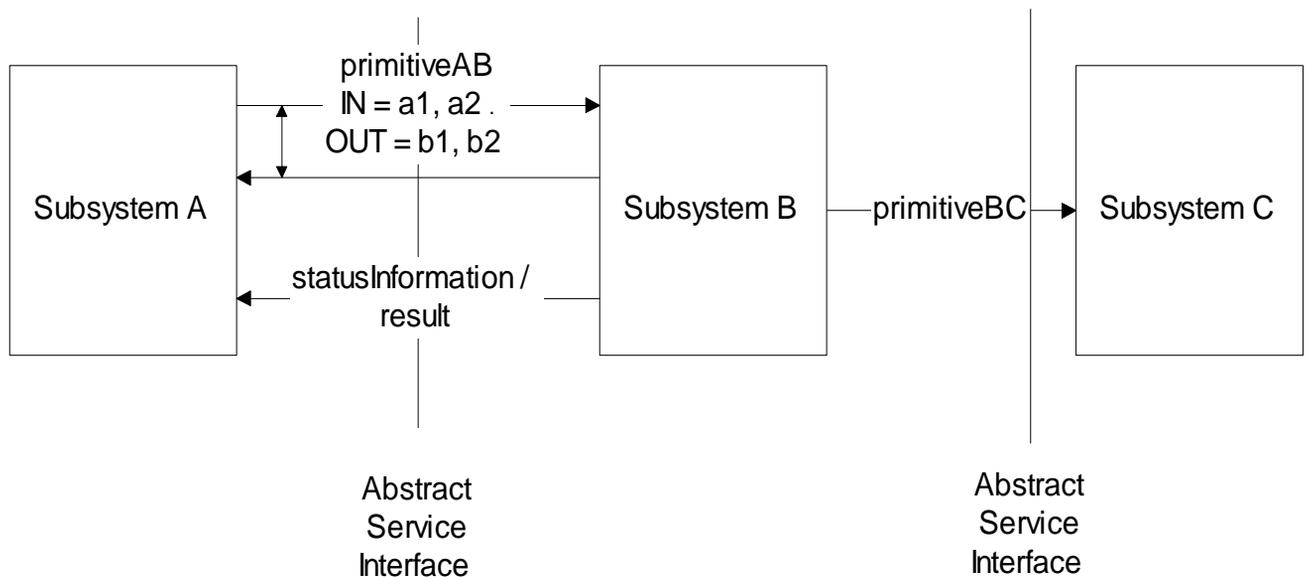

Figure 7.4(a) Abstract Service Interface

## Notes

- Abstract service interface is a conceptual interface between modules, independent of implementation
- Defines a set of primitives
- Primitives associated with receiving entities except for Dispatcher
- Dispatcher primitives associated with
  - messages to and from applications
  - registering and un-registering of application modules
  - transmitting to and receiving messages from network
- IN and OUT parameters
- Status information / result

# sendPDU Primitive

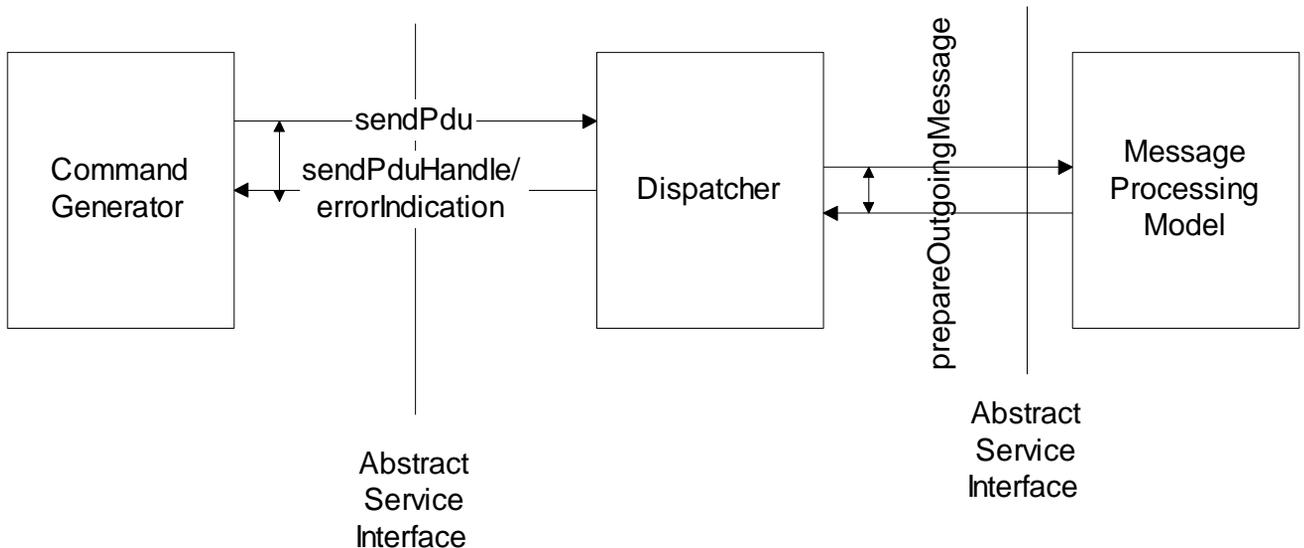

Figure 7.4(b) Abstract Service Interface for sendPdu

## Notes

- sendPdu request sent by the application module, command generator, is associated with the receiving module, dispatcher
- After the message is transmitted over the network, dispatcher sends a handle to the command generator for tracking the response
- sendPdu is the IN parameter
- sendPduHandle is the OUT parameter, shown as coupled to the IN parameter

---

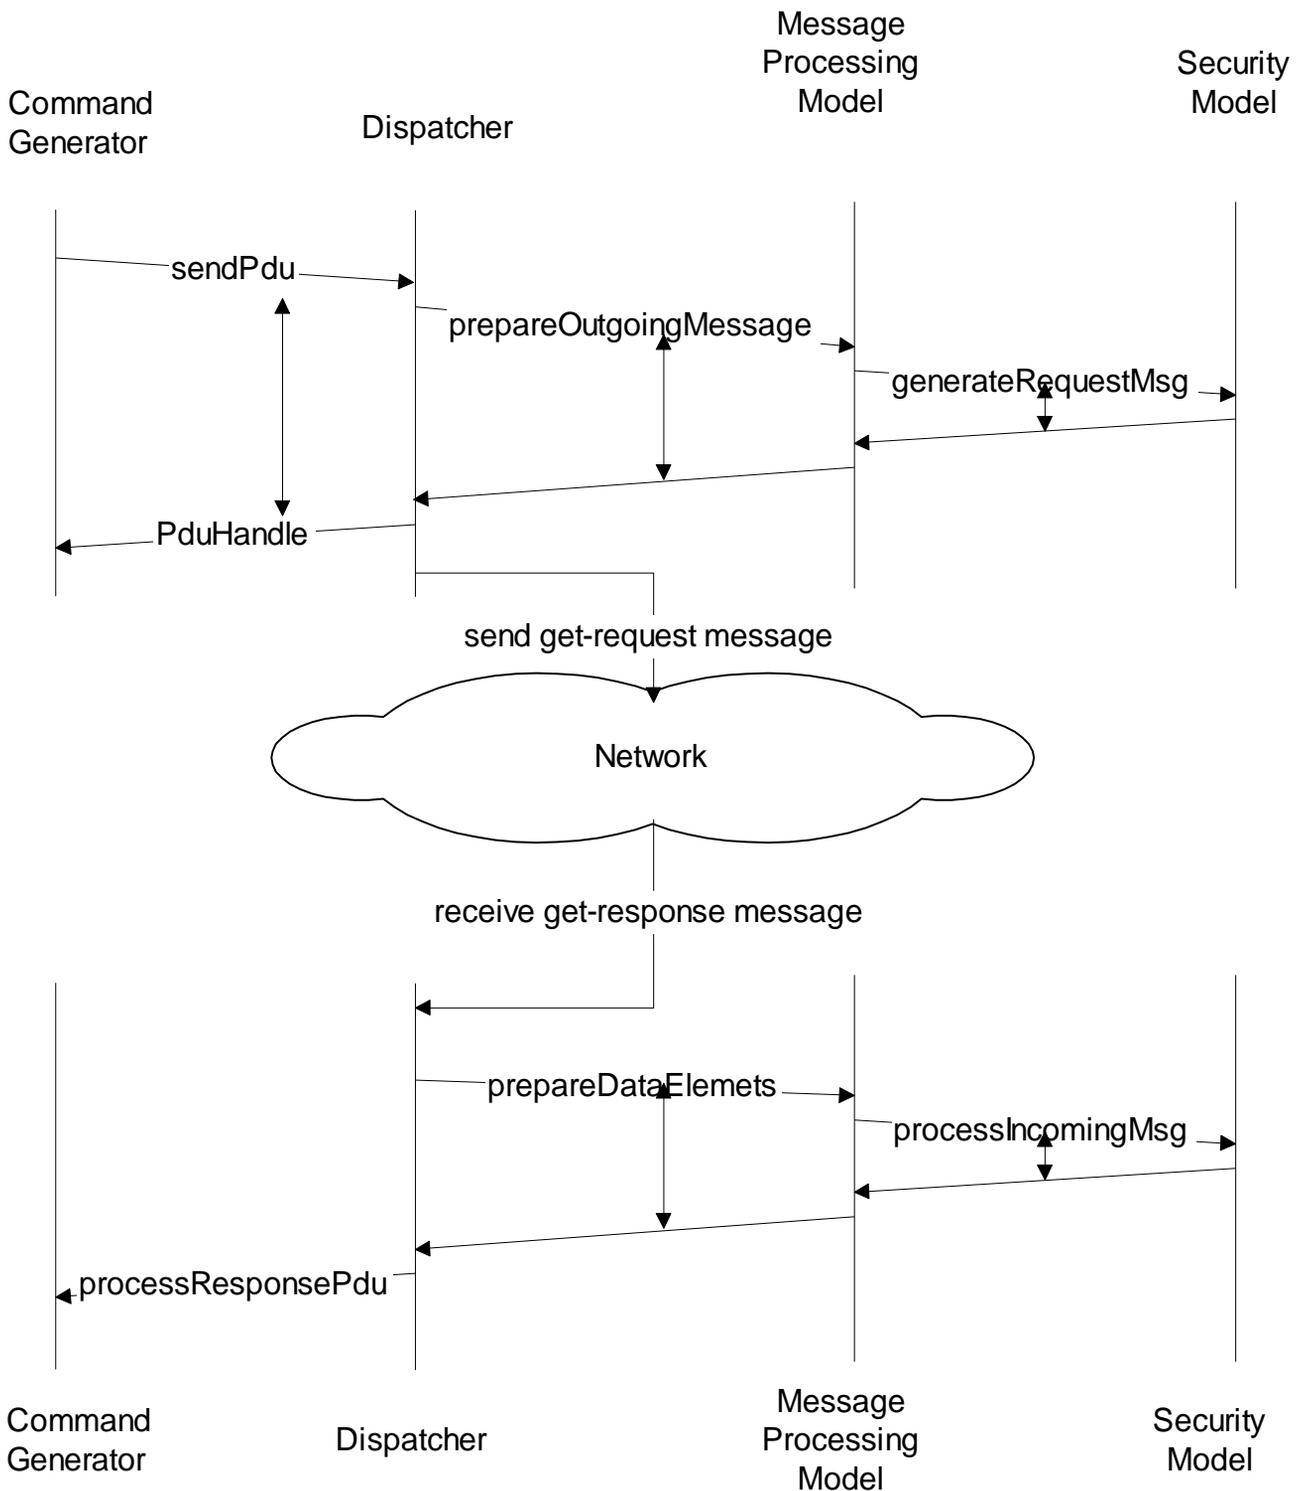

# Dispatcher Primitives

| <b>Module</b> | <b>Primitive</b>          | <b>Service Provided</b>                                   |
|---------------|---------------------------|---|
| Dispatcher    | sendPdu                   | Request from application to send a PDU to a remote entity |
| Dispatcher    | processPdu                | Processing of incoming message from remote entity         |
| Dispatcher    | returnResponsePdu         | Request from application to send a response PDU           |
| Dispatcher    | processResponsePdu        | Processing of incoming response from a remote entity      |
| Dispatcher    | registerContextEngineID   | Register request from a Context Engine                    |
| Dispatcher    | unregisterContextEngineID | Unregister request from a Context Engine                  |

---

## Notes

# Command Generator

# Command Responder

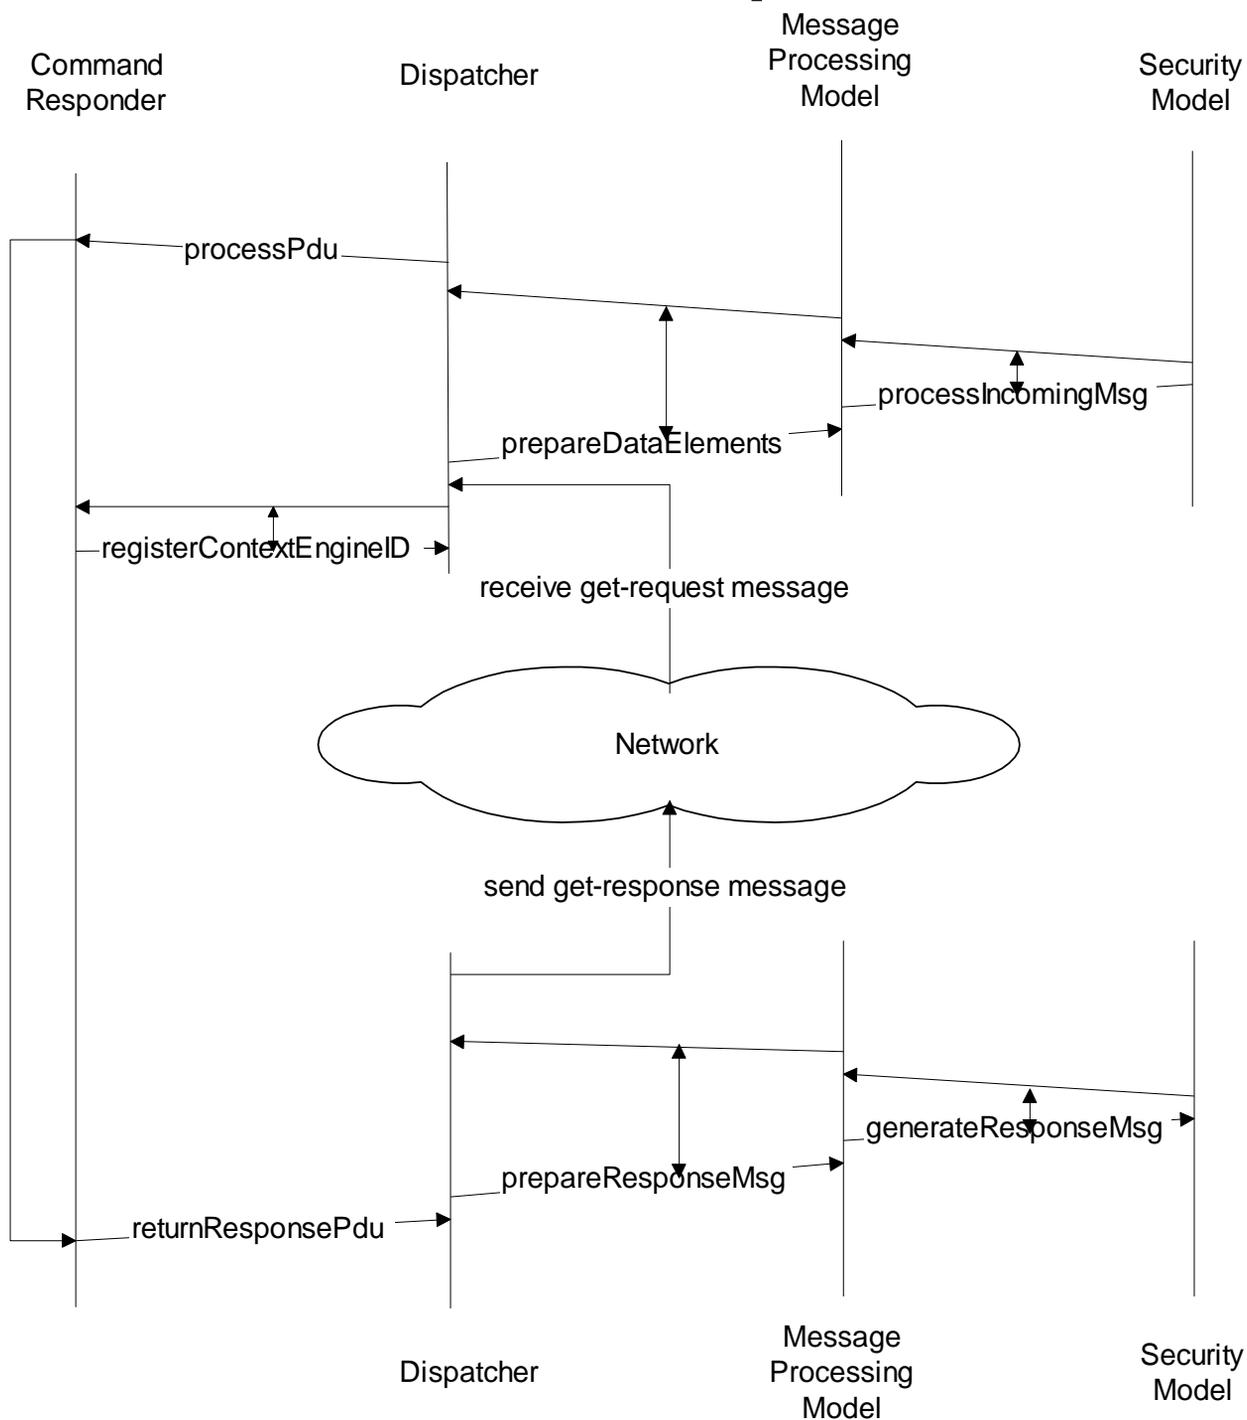

Figure 7.6 Command Responder Application

# Notification / Proxy

- Notification originator
  - Generates trap and inform messages
  - Determine target, SNMP version, and security
  - Decides context information
- Notification receiver
  - Registers with SNMP engine
  - Receives notification messages
- Proxy forwarder
  - Proxy server
  - Handles only SNMP messages by
    - Command generator
    - Command responder
    - Notification generator
    - Report indicator
  - Uses the translation table in the proxy group MIB

---

## Notes

# SNMPv2 MIB

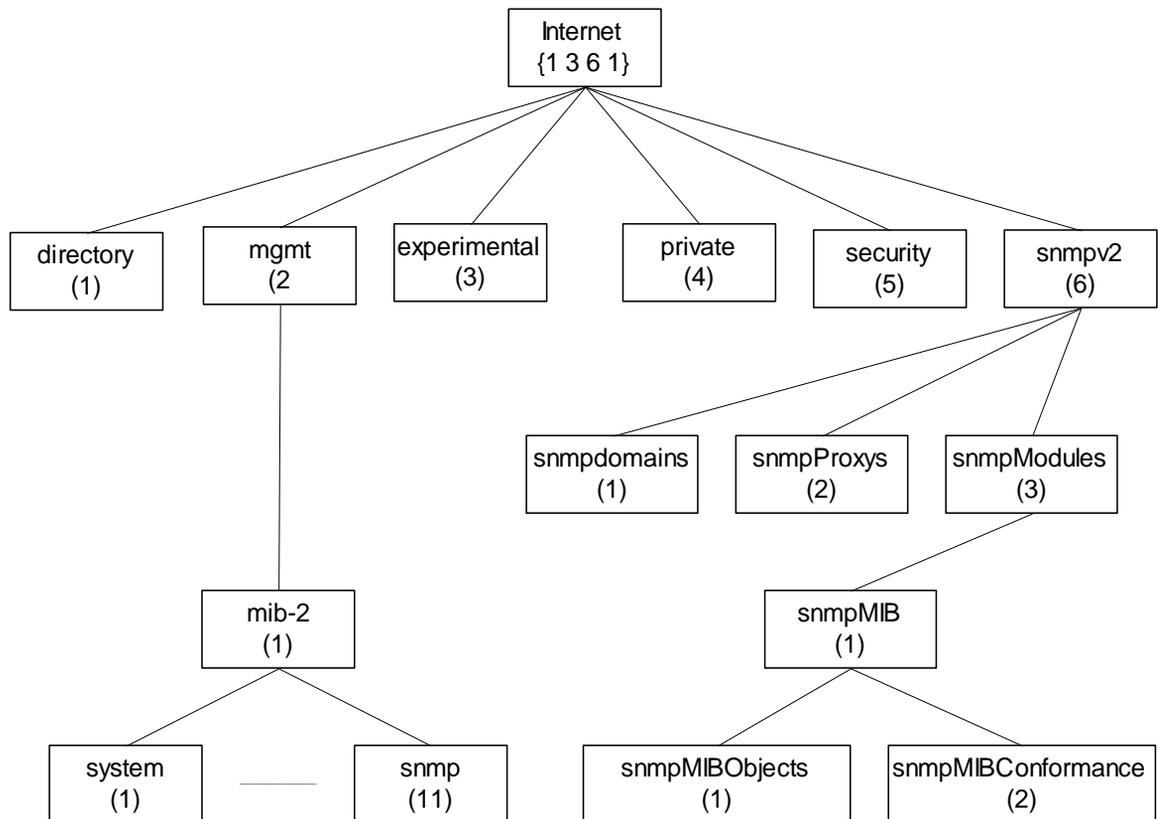

Figure 6.31 SNMPv2 Internet Group

## Notes

- SNMPv3 MIB developed under snmpModules
- Security placeholder not used

# SNMPv3 MIB

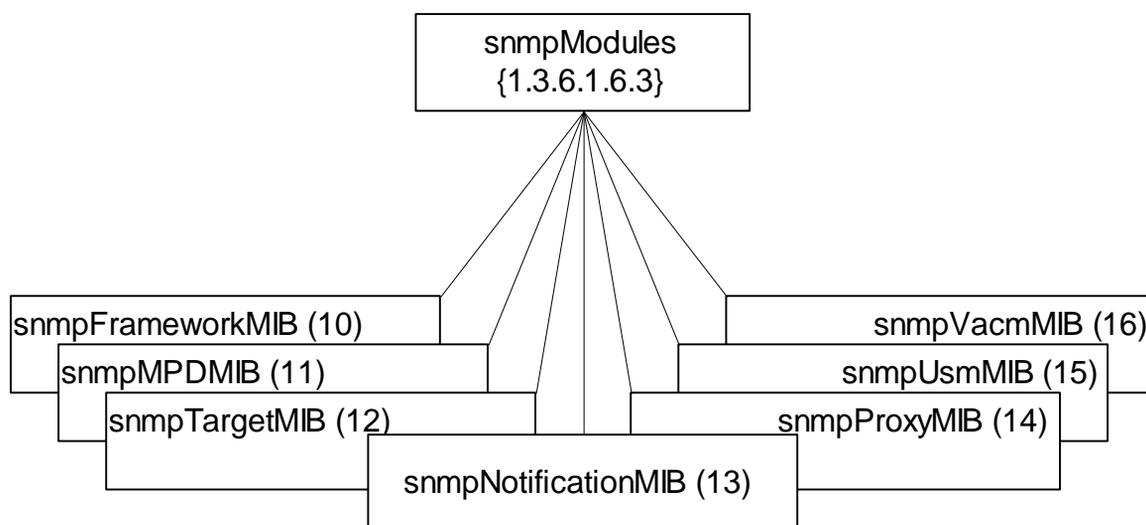

Figure 7.7 SNMPv3 MIB

## Notes

- snmpFrameworkMIB describes SNMP management architecture
- snmpMPDMIB identifies objects in the message processing and dispatch subsystems
- snmpTargetMIB and snmpNotificationMIB used for notification generation
- snmpProxyMIB defines translation table for proxy forwarding
- snmpUsmMIB defines user-based security model objects
- snmpVacmMIB defines objects for view-based access control

# SNMPv3 Target MIB

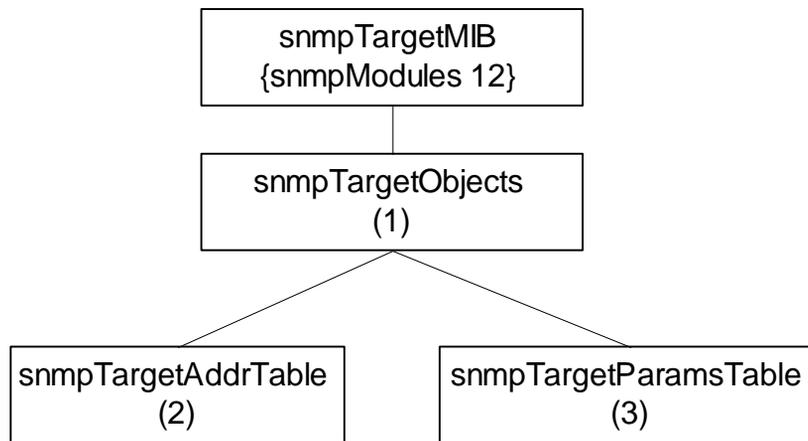

Figure 7.8 Target Address and Target Parameter Tables

## Notes

- Target MIB contains two tables
- Target address table contains addresses of the targets for notifications (see notification group)
- Target address table also contains information for establishing the transport parameters
- Target address table contains reference to the second table, target parameter table
- Target parameter table contains security parameters for authentication and privacy

# SNMPv3 Notification MIB

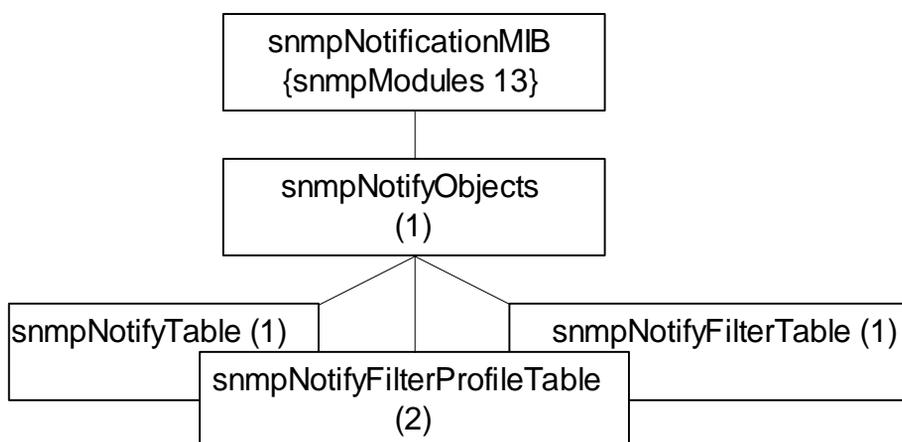

Figure 7.9 SNMP Notification Tables

## Notes

- Notification group contains three tables
- Notify table contains groups of management targets to receive notifications and the type of notifications
- The target addresses to receive notifications that are listed in target address table (see target group) are tagged here
- Notification profile table defines filter profiles associated with target parameters
- Notification filter table contains table profiles of the targets

# Security Threats

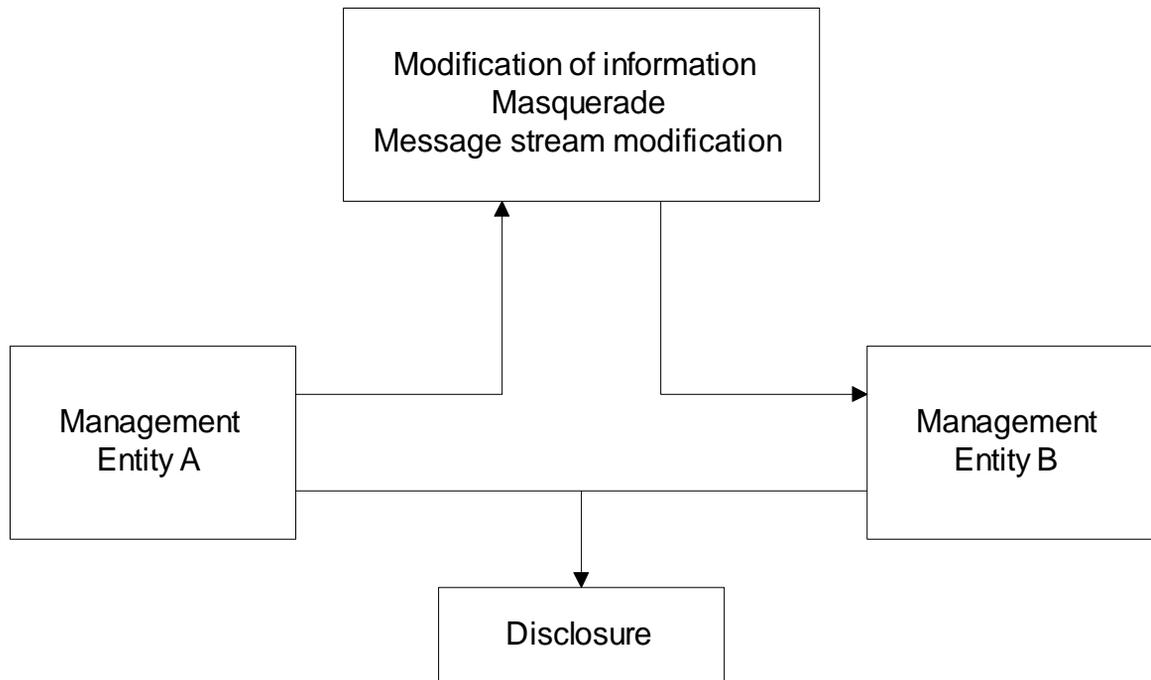

Figure 7.10 Security Threats to Management Information

## Notes

- Modification of information: Contents modified by unauthorized user, does not include address change
- Masquerade: change of originating address by unauthorized user
- Fragments of message altered by an unauthorized user to modify the meaning of the message
- Disclosure is eavesdropping
- Disclosure does not require interception of message
- Denial of service and traffic analysis are not considered as threats

# Security Services

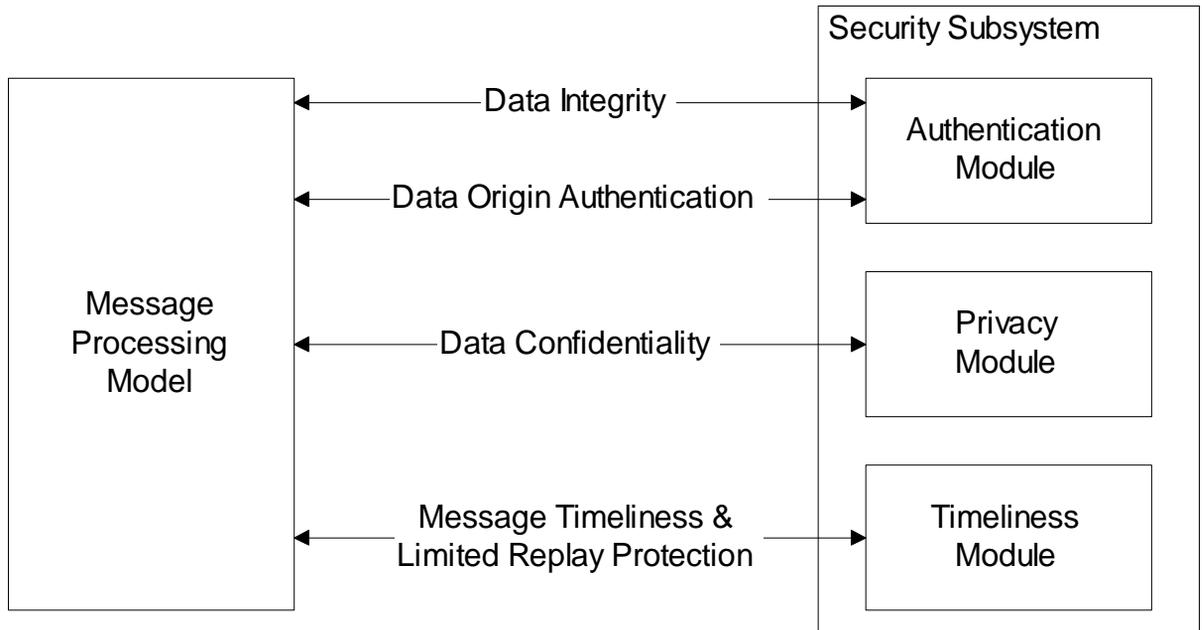

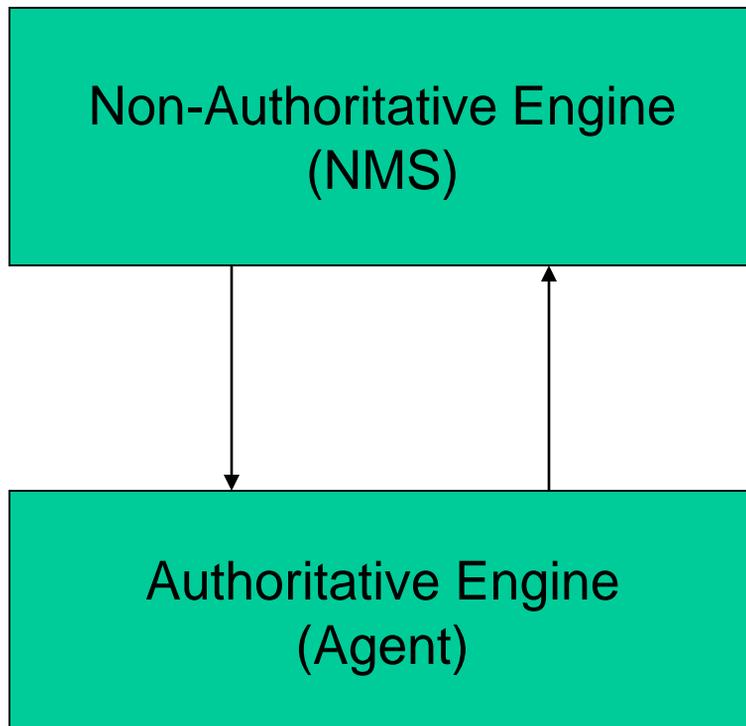

Figure 7.11 Security Services

## Notes

- Authentication
  - Data integrity:
    - HMAC-MD5-96 / HMAC-SHA-96
  - Data origin authentication
    - Append to the message a unique Identifier associated with authoritative SNMP engine
- Privacy / confidentiality:
  - Encryption
- Timeliness:
  - Authoritative Engine ID, No. of engine boots and time in seconds

---

# Role of SNMP Engines

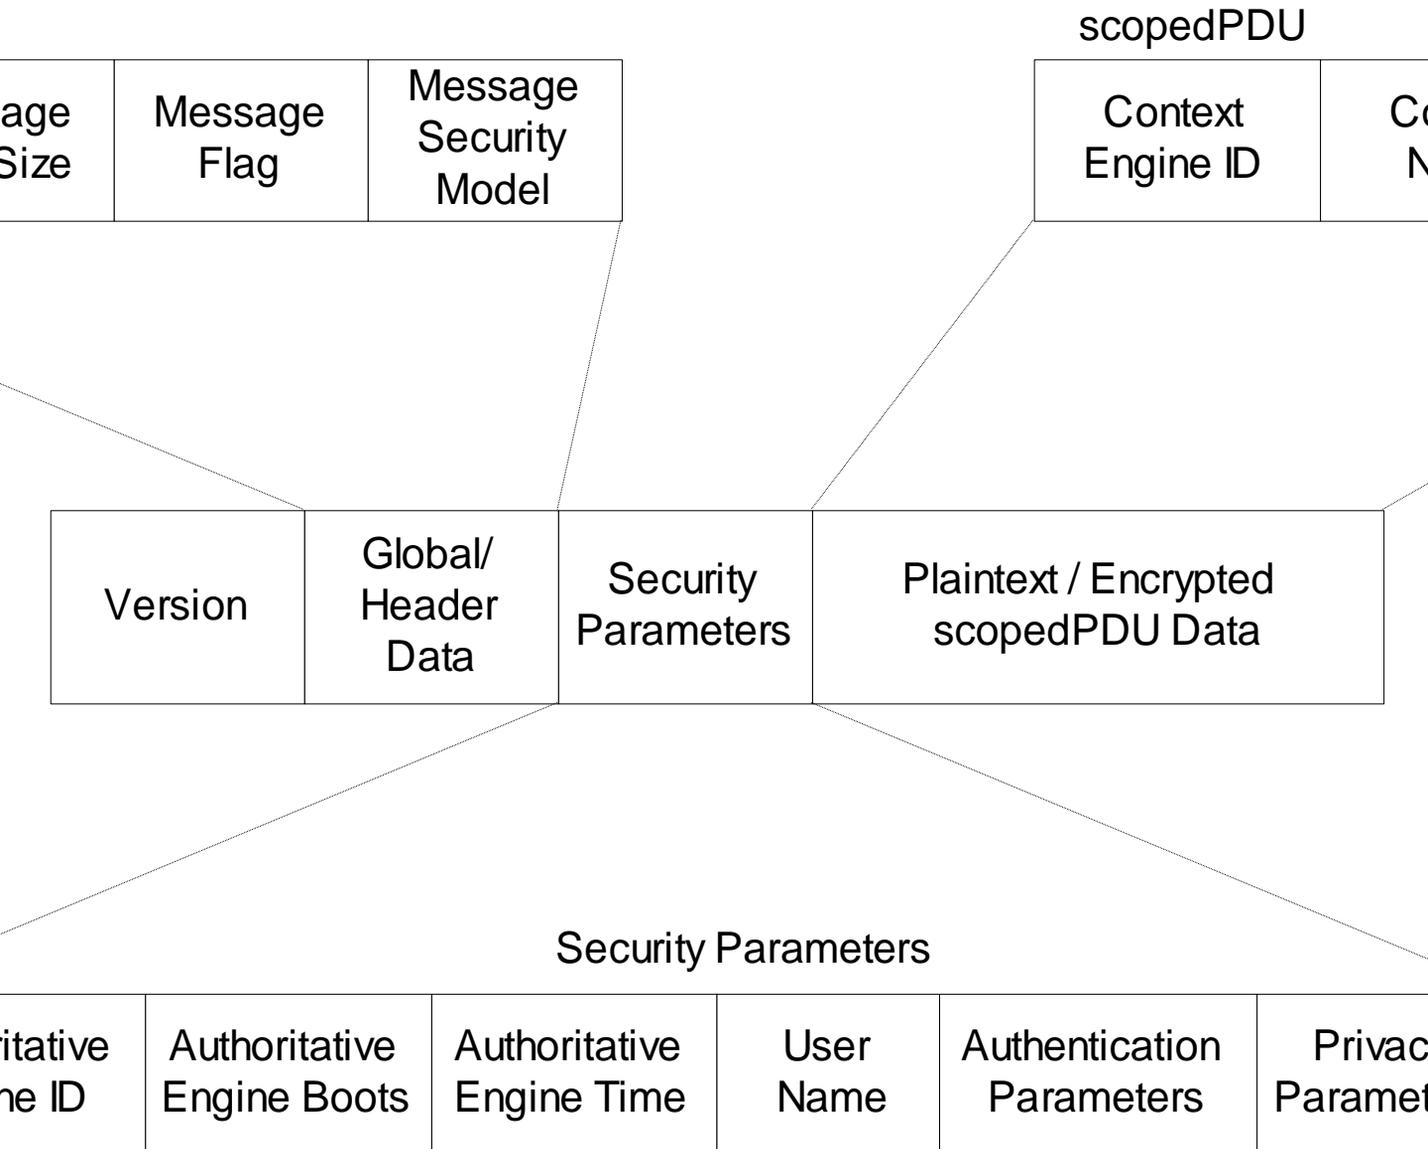

---

## Notes

- Responsibility of Authoritative engine:
  - Unique SNMP engine ID
  - Time-stamp
- Non-authoritative engine should keep a table of the time-stamp and authoritative engine ID

# SNMPv3 Message Format

**Figure 7.12 SNMPv3 Message Format**

# SNMPv3 Message Format

| Field                               | Object name           | Description   |
|-------------------------------------|-----------------------|---|
| Version                             | msgVersion            | SNMP version number of the message format   |
| Message ID                          | msgID                 | Administrative ID associated with the message   |
| Message Max. Size                   | msgMaxSize            | Maximum size supported by the sender  |
| Message flags                       | msgFlags              | Bit fields identifying report, authentication, and privacy of the message                 |
| Message Security Model              | msgSecurityModel      | Security model used for the message; concurrent multiple models allowed                   |
| Security Parameters (See Table 7.8) | msgSecurityParameters | Security parameters used for communication between sending and receiving security modules |
| Plaintext/Encrypted scopedPDU Data  | scopedPduData         | Choice of plaintext or encrypted scopedPDU; scopedPDU uniquely identifies context and PDU |
| Context Engine ID                   | contextEngineID       | Unique ID of a context (managed entity) with a context name realized by an SNMP entity    |
| Context Name                        | contextName           | Name of the context (managed entity)  |
| PDU                                 | data                  | Contains unencrypted PDU  |

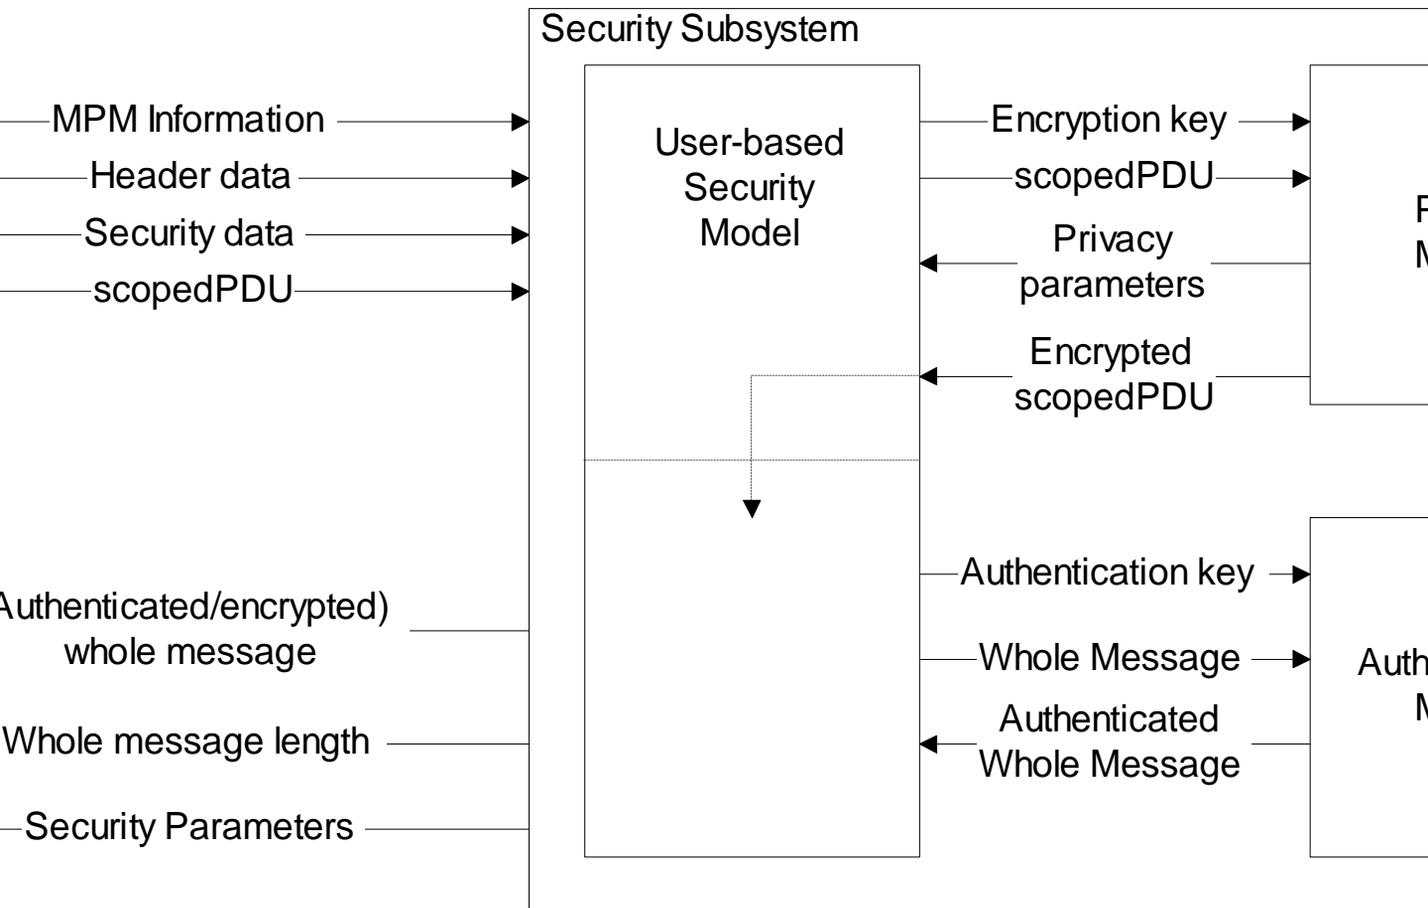

# User-Based Security Model

- Based on traditional user name concept
- USM primitives across abstract service interfaces
  - Authentication service primitives
    - authenticateOutgoingMsg
    - authenticateIncomingMsg
  - Privacy Services
    - encryptData
    - decryptData

---

## Notes

# Secure Outgoing Message

**Figure 7.13 Privacy and Authentication Service for Outgoing Message**

## Notes

- USM invokes privacy module w/ encryption key and scopedPDU
- Privacy module returns privacy parameters and encrypted scopedPDU
- USM then invokes the authentication module w/authentication key and Whole Message and receives authenticated whole message

# Secure Incoming Message

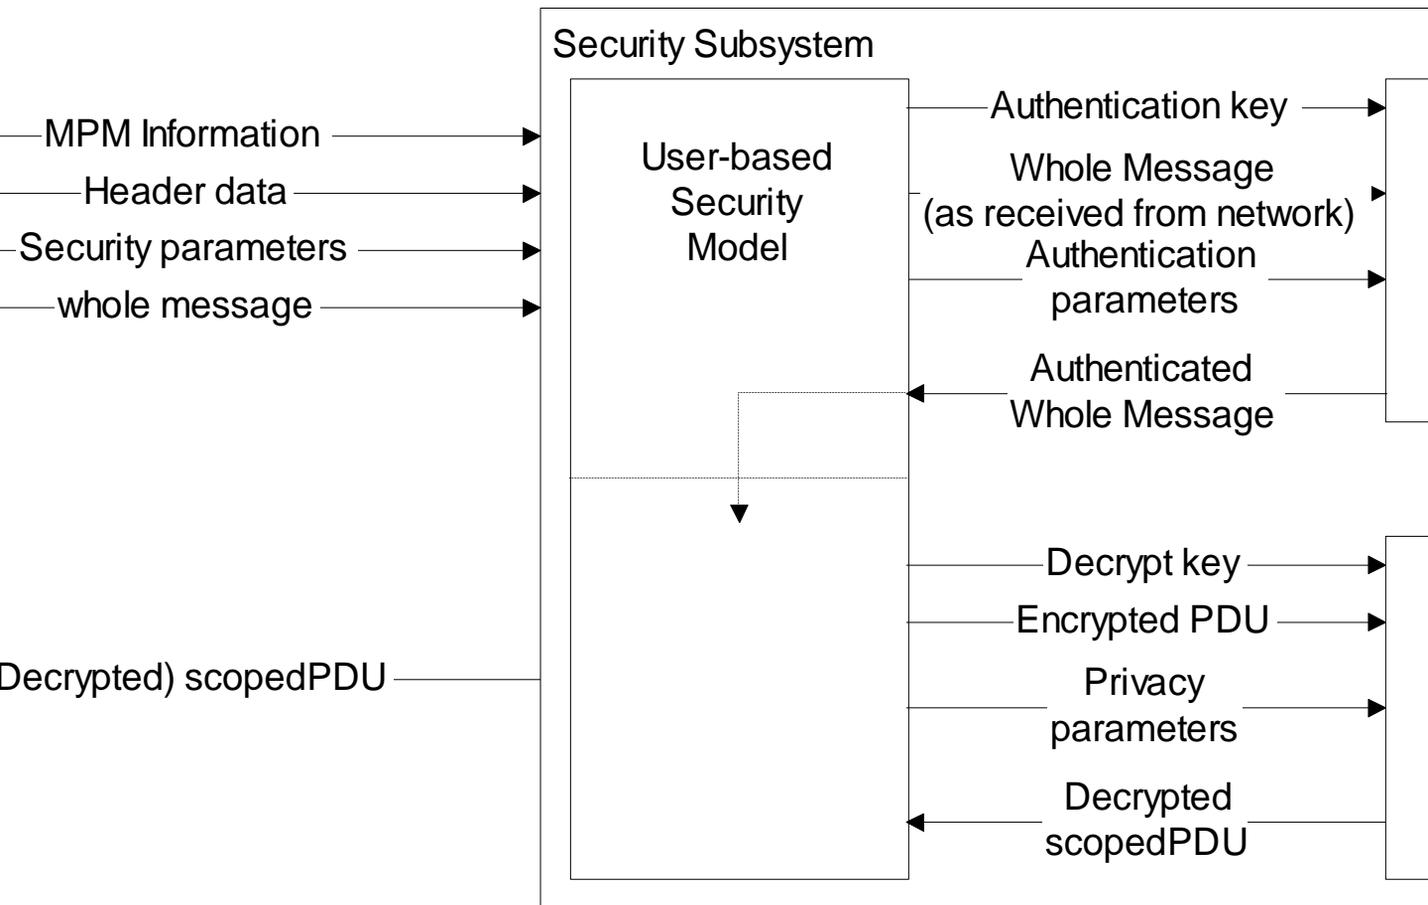

Figure 7.14 Privacy and Authentication Service for Incoming Message

## Notes

- Processing secure incoming message reverse of secure
- Authentication validation done first by the authentication
- Decryption of the message done then by the privacy mod

# Security Parameters

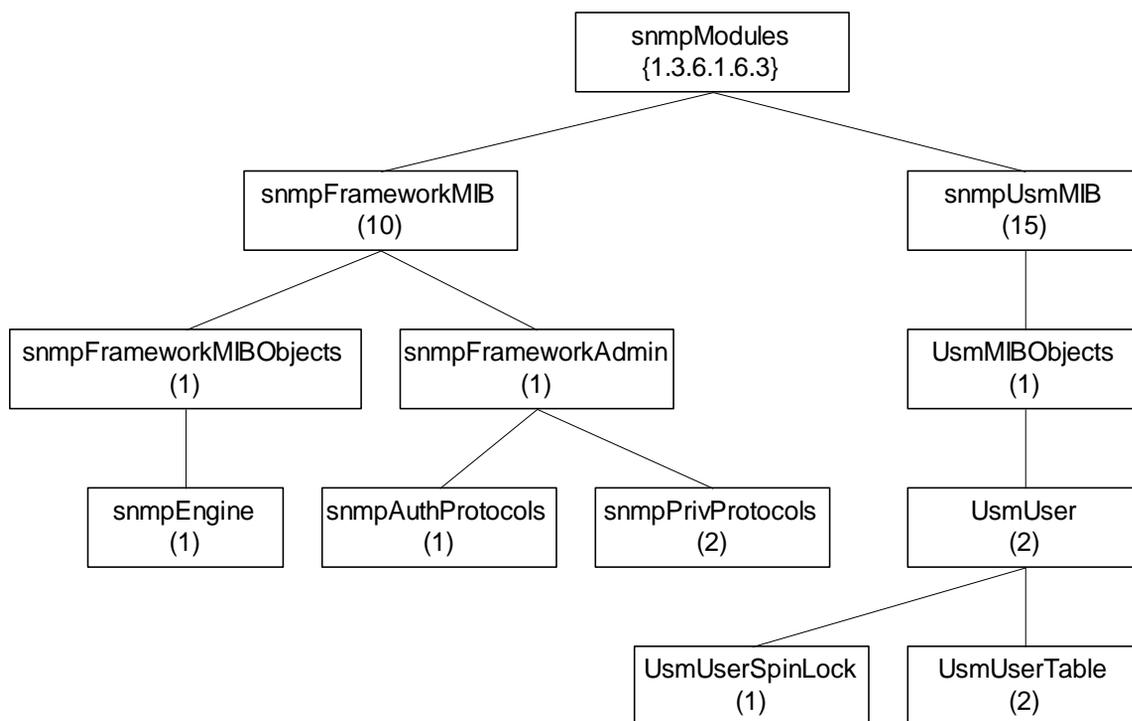

Figure 7.15 SNMPv3 MIB Objects for Security Parameters

## Notes

Table 7.8 Security Parameters and Corresponding MIB Objects

| Security Parameters         | USM User Group Objects                   |
|-----------------------------|--|
| msgAuthoritativeEngineID    | snmpEngineID (under snmpEngine Group)    |
| msgAuthoritativeEngineBoots | snmpEngineBoots (under snmpEngine Group) |
| msgAuthoritativeEngineTime  | snmpEngineTime (under snmpEngine Group)  |
| msgUserName                 | usmUserName (in usmUserTable)            |
| msgAuthenticationParameters | usmUserAuthProtocol (in usmUserTable)    |
| msgPrivacyParameters        | usmUserPrivProtocol (in usmUserTable)    |

# Privacy Module

- Encryption and decryption of scoped PDU (context engine ID, context name, and PDU)
- CBC - DES (Cipher Block Chaining - Data Encryption Standard) symmetric protocol
- Encryption key (and initialization vector) made up of secret key (user password), and timeliness value
- Privacy parameter is *salt* value (unique for each packet) in CBC-DES

---

## Notes

# Authentication Key

- Secret key for authentication
- Derived from user (NMS) password
- MD5 or SHA-1 algorithm used
- Authentication key is *digest2*

---

## Notes

Procedure:

1. Derive *digest0*:

Password repeated until it forms  $2^{20}$  octets.

2. Derive *digest1*:

Hash *digest0* using MD5 or SHA-1.

3. Derive *digest2*:

Concatenate authoritative SNMP engine ID and *digest1* and hash with the same algorithm

---

# Authentication Parameters

- Authentication parameter is Hashed Message Access Code (HMAC)
- HMAC is 96-bit long (12 octets)
- Derived from authorization key (*authKey*)

---

## Notes

Procedure:

1. Derive *extendedAuthKey*:

Supplement *authKey* with 0s to get 64-byte string

2. Define *ipad*, *opad*, K1, and K2:

*ipad* = 0x36 (00110110) repeated 64 times

*opad* = 0x5c (01011100) repeated 64 times

K1 = *extendedAuthKey* XOR *ipad*

K2 = *extendedAuthKey* XOR *opad*

3. Derive HMAC by hashing algorithm used

HMAC = H (K2, H (K1, *wholeMsg*))

# Encryption Protocol

- Cipher Block Chaining mode of Data Encryption Standard (CBC-DES) protocol
- 16-octet *privKey* is secret key
- First 8-octet of *privKey* used as 56-bit DES key; (Only 7 high-order bits of each octet used)
- Last 8-octet of *privKey* used as pre-initialization vector

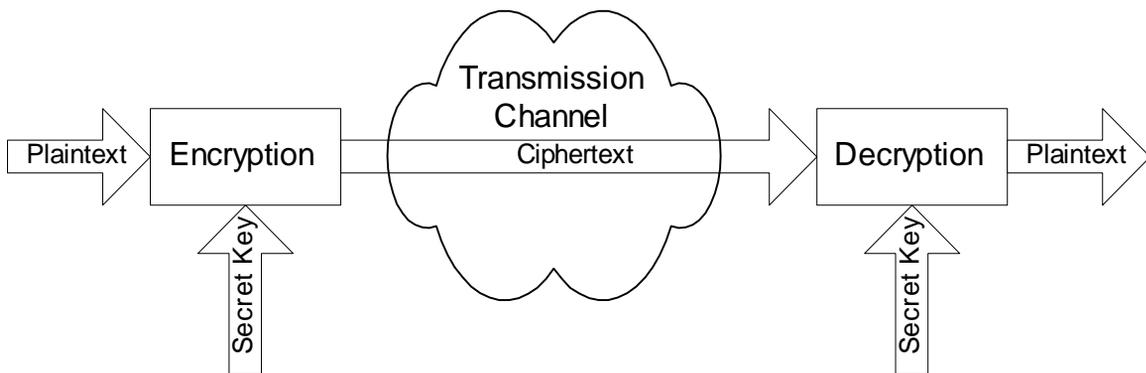

Figure 13.33 Basic Cryptographic Communication

## Notes

- CBC Mode
  - Plaintext divided into 64-bit blocks
  - Each block is XOR-d with ciphertext of the previous block and then encrypted
  - Use pre-IV (initialization vector) for prefixing the first message block

# Access Control

- View-based Access Control Model
  - Groups: Name of the group comprising security model and security name:  
In SNMPv1, is community name
  - Security Level
    - no authentication - no privacy
    - authentication - no privacy
    - authentication - privacy
  - Contexts: Names of the context
  - MIB Views and View Families
    - MIB view is a combination of view subtrees
  - Access Policy
    - read-view
    - write-view
    - notify-view
    - not-accessible

---

## Notes

# VCAM Process

Answers 6 questions:

1. Who are you (group)?
2. Where do you want to go (context)?
3. How secured are you to access the information (security model and security level)?
4. Why do you want to access the information (read, write, or send notification)?
5. What object (object type) do you want to access?
6. Which object (object instance) do you want to access?

---

## Notes

# VCAM Process

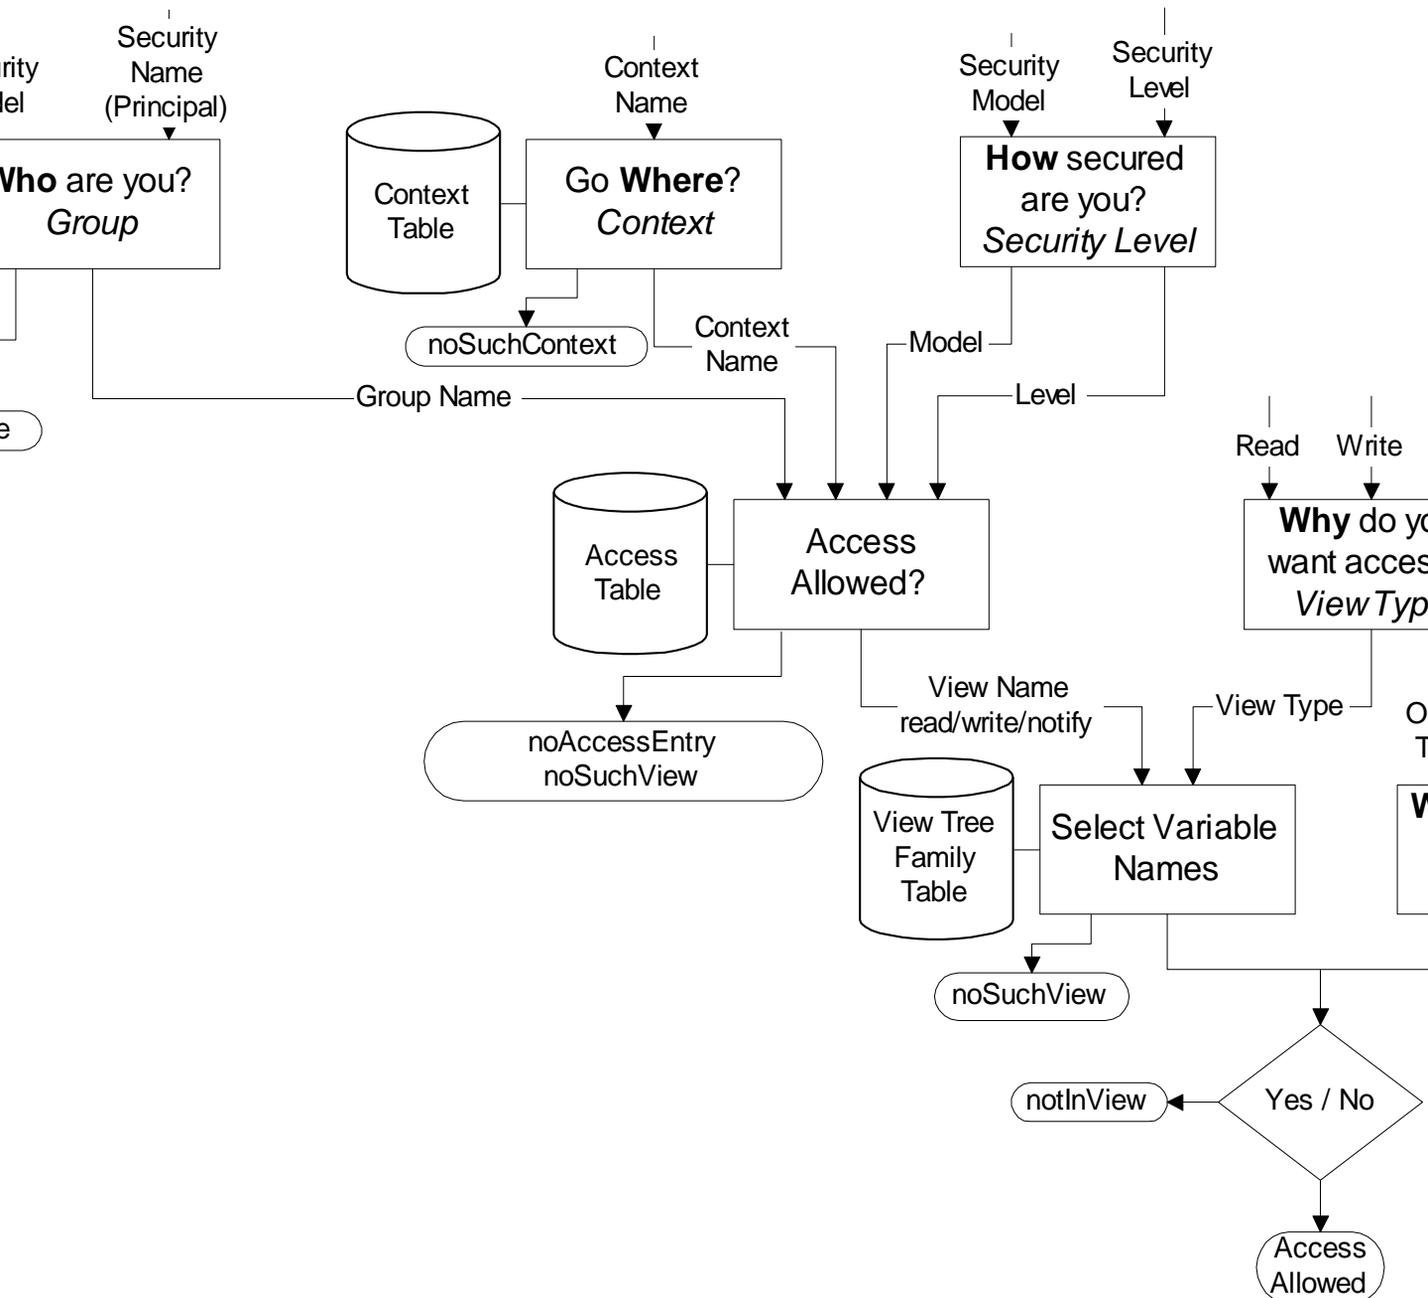

Figure 7.16 VACM Process

# VACM MIB

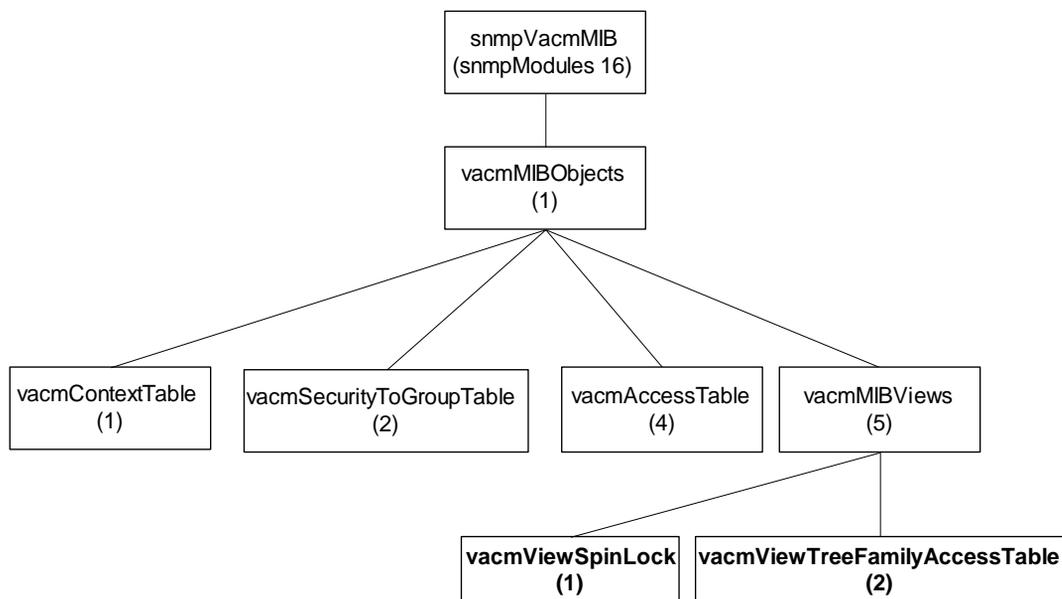

Figure 7.17 VACM MIB

## Notes

- Four tables used to achieve access control
  - Group defined by security-to-group table
  - Context defined by context table
  - Access determines access allowed and the view name
  - View tree family table determines the MIB view, which is very flexible

# MIB Views

Simple view:

*system*            1.3.6.1.2.1.1

Complex view:

All information relevant to a particular interface -  
*system* and *interfaces* groups

Family view subtrees

View with all columnar objects in a row appear  
as separate subtree.

OBJECT IDENTIFIER (family name)

paired with

bit-string value (family mask)

to select or suppress columnar objects

---

## Notes

# VACM MIB View

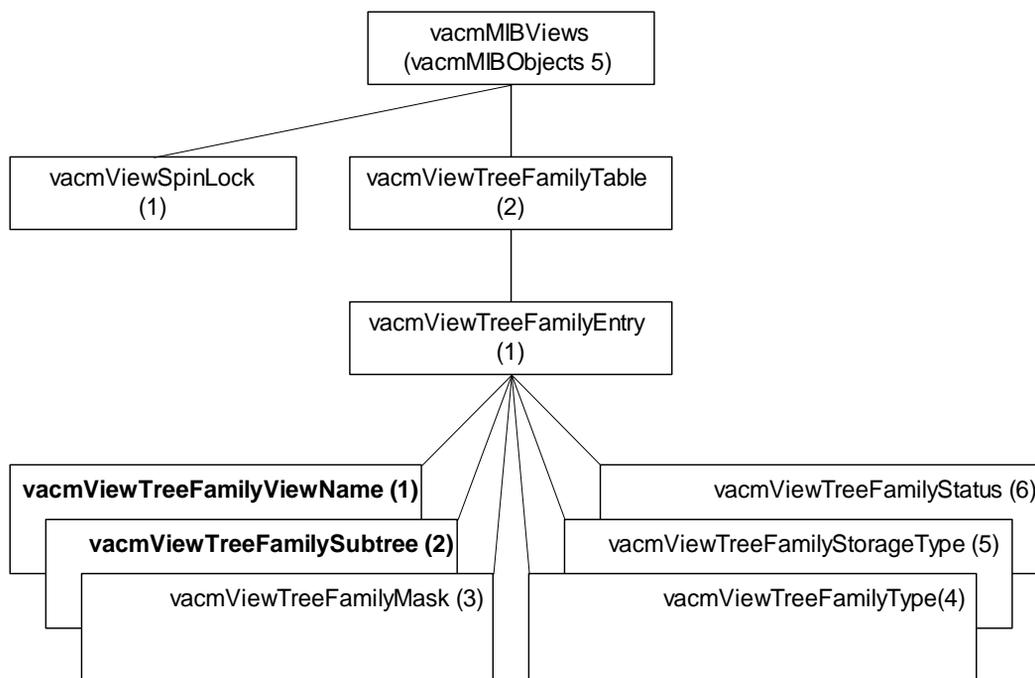

Figure 7.19 VACM MIB Views

## Notes

Example:

Family view name = “system”

Family subtree = 1.3.6.1.2.1.1

Family mask = “” (implies all 1s by convention)

Family type = 1 (implies value to be included)
